

Developments and trends for investors in the global energy sector

This is a marketing communication. Please refer to the prospectus and KIID for the Fund before making any final investment decisions. Past performance does not predict future returns.

October 2022

GUINNESS GLOBAL ENERGY FUND

The Guinness Global Energy Fund invests in listed equities of companies engaged in the exploration, production and distribution of oil, gas and other energy sources. We believe that over the next twenty years the combined effects of population growth, developing world industrialisation and diminishing fossil fuel supplies will force energy prices higher and generate growing profits for energy companies. The Fund is actively managed and uses the MSCI World Energy Index as a comparator benchmark only.

The Fund is run by co-managers Will Riley, Jonathan Waghorn and Tim Guinness, supported by Jamie Melrose (analyst). The investment philosophy, methodology and style which characterise the Guinness approach have been applied to the management of energy equity portfolios since 1998.

RISK

The Guinness Global Energy Fund is an equity fund. Investors should be willing and able to assume the risks of equity investing. The value of an investment and the income from it can fall as well as rise as a result of market and currency movement, and you may not get back the amount originally invested. The Fund invests only in companies involved in the energy sector; it is therefore susceptible to the performance of that one sector, and can be volatile. Details on the risk factors are included in the Fund's documentation, available on our website.

The risk and reward indicator shows where the fund ranks in terms of its potential risk and return. The fund is ranked as higher risk as its price has shown high fluctuations historically. This is based on how investments have performed in the past and you should note that the fund may perform differently in the future and its rank may change. Historic data may not be a reliable indicator for the future.

HIGHLIGHTS FOR SEPTEMBER

OIL

Brent/WTI fall as demand destruction concerns build

Brent and WTI spot oil prices fell in September. Brent and WTI closed the month at \$86/bl and \$79/bl, both down by around \$10/bl over the month. Five-year forward prices declined by around \$5/bl, Brent closing at \$65/bl and WTI at \$58/bl. Concerns around a global GDP slowdown, COVID mitigation measures in China and the resilience of Russian supply all continued to weigh on prices. OPEC+ met on October 5 and agreed a headline 2m b/day quota cut, which likely translates into an actual production cut of around 1m b/day.

NATURAL GAS

US, European and Asian gas prices decline

The European and Asian gas prices (using UK NBP) closed September at \$27/\$39 /mcf, whilst the US spot price (Henry Hub) fell to \$6.8/mcf. European gas inventories have filled well over the past few weeks and have returned to the five-year average. Against this, sabotage on the Nordstream pipelines in late September has reduced the prospect of Russian gas flows recovering to previous levels.

EQUITIES

Energy underperforms the broad market in September

The MSCI World Energy Index (net return) fell by 9.4% in September, underperforming the MSCI World Index (net return) which fell by 9.3% over the month (all in US dollar terms).

CHART OF THE MONTH

Strategic Petroleum Reserves

In response to the tight oil market and shortfalls from Russia, the US announced Strategic Reserve releases of 160m barrels. These have been supported by a further c.120m barrel release across 30 US-allied IEA members. Together, the SPR releases represent around 20% of IEA Reserves. The releases from the US SPR are due to finish in mid-November, removing a key source of market supply.

1. SEPTEMBER IN REVIEW

i) Oil market

Oil price (WTI and Brent \$/barrel): Feb 2021 to Sept 2022

Source: Bloomberg; Guinness Global Investors

The West Texas Intermediate (WTI) oil price started September at \$90/bl, generally declined over the month to reach a low of \$76/bl on September 26, before closing slightly higher at \$79/bl. WTI has averaged \$99/bl so far this year, having averaged \$68/bl in 2021, \$40/bl in 2020 and \$58/bl in 2019.

Brent oil traded in a similar shape, opening at \$96/bl, troughing at \$83/bl and closing the month at \$86/bl. Brent has averaged \$104/bl so far in 2022, having averaged \$70/bl in 2021, \$42/bl in 2020 and \$64/bl in 2019. The gap between the WTI and Brent benchmark oil prices widened over the month, ending August at just under \$7/bl. The Brent-WTI spread averaged \$2.4/bl in 2021.

Factors which strengthened WTI and Brent oil prices in September:

• OPEC+ output well behind quotas

In theory, OPEC+ production should have grown by around 3.7m b/day so far this year, representing quota increases of 0.4m b/day up to June, then 0.6m b/day in July and August. In reality, the group's production is up by around 1.8m b/day, with a decline from Russia and anaemic growth from many OPEC members contributing to the result. OPEC+ met on October 5 and agreed a headline 2m b/day quota cut, which likely translates into an actual production cut of around 1m b/day. OPEC provided two reasons for the cut: first, a micromanagement of short-term demand weakness, and second, a push for higher prices to incentivise new investment.

• OECD inventories close to bottom of 10-year range

OECD total product and crude inventories at the end of August (latest data point) were estimated by the IEA to be 2,709m barrels, up by 5m barrels versus the level reported for July. The inventory level reported for August is

around 5% below the 10-year average, and close to the bottom of the 10-year range. Low inventories were a key catalyst for the US and other IEA members in March to announce record releases from Strategic Petroleum Reserves.

Nordstream pipeline sabotage likely to increase gas-to-oil switching

On September 26, pressure on the Nordstream 1 and 2 natural gas pipelines dropped significantly. It became clear that the pressure drop was caused by explosions on both pipelines, occurring in international waters. Neither pipeline was actively supplying gas, but we see this activity by Russia as i) a warning shot that Europe's offshore pipeline system is vulnerable, and ii) Russia's effort to maintain a high price for its gas flowing via other routes. Sabotage of the Nordstream pipelines will also boost gas-to-oil switching, which is currently running globally at around 1.3m b/day.

Factors which weakened WTI and Brent oil prices in September:

Global GDP slowdown

Global economic forecasts have deteriorated further. The IMF cut its global GDP growth forecast for 2022 to 3.2% and for 2023 to 2.9%, a downgrade from its April projection by 0.4 and 0.7 percentage points, respectively. The IMF cited "an increasingly gloomy and uncertain outlook", with the war in Ukraine, high commodity prices and China's lockdowns weighing on growth. This in turn has put pressure on global oil demand, especially in Europe.

• COVID surge in China

The current surge of COVID in China has impacted forecasts for oil demand. The IEA are currently forecasting Chinese demand for 2022 to average 15.0m b/day (downgraded from 15.3m b/day a month before), a drop of 0.4m b/day versus 2021. If this forecast proves accurate, it will be the first annual drop in China's consumption of oil this century. Against this, the IEA expect Chinese demand to rise in 2023 to 16.0m b/day, as the impacts of COVID are unwound.

Russia supply

Russian supply has proved more resilient than some commentators expected, with production in July (latest data) down by only 0.5m b/day versus the start of the year. Supply in April and May had fallen by around 1m b/day from pre-invasion levels, but the bounce since then has been driven by higher domestic consumption and the rerouting of crude exports from Europe to Asia.

• Libya supply

The IEA reports that Libyan supply rebounded in August 2022 (latest data) to around 1.1m b/day, up from 0.7m b/day in July. The first tankers arrived in Libya to load oil for export in mid-July, ending a force majeure on key oilfields and ports that had been in place since April 2022.

Speculative and investment flows

The New York Mercantile Exchange (NYMEX) net non-commercial crude oil futures open position was 226,000 contracts long at the end of September versus 228,000 contracts long at the end of August. The net position peaked in February 2018 at 739,000 contracts long. Typically, there is a positive correlation between the movement in net position and movement in the oil price. The gross short position grew slightly to 108,000 contracts at the end of September versus 103,000 at the end of the previous month.

NYMEX Non-commercial net and short futures contracts: WTI January 2004 – September 2022

Source: Bloomberg LP/NYMEX/ICE (2022)

OECD stocks

OECD total product and crude inventories at the end of August (latest data point) were estimated by the IEA to be 2,709m barrels, up by 5m barrels versus the level reported for July. This compares to a 10-year average build for August of 13m barrels, implying that the OECD market was slightly undersupplied. The significant oversupply situation in 2020 pushed OECD inventory levels close to maximum capacity in August 2020 (c3.3bn barrels), with persistent tightening thereafter taking inventories well below normal levels.

OECD total product and crude inventories, monthly, 2004 to 2022

Source: IEA Oil Market Reports (Sept 2022 and older)

ii) Natural gas market

The US natural gas price (Henry Hub front month) opened September at \$9.13/mcf (1,000 cubic feet) and fell sharply over the month to a low on September 27 of \$6.65, before closing slightly higher at \$6.77/mcf. The spot gas price has averaged \$6.66/mcf so far in 2022, having averaged \$3.70/mcf in 2021, \$2.13/mcf in 2020 and \$2.53/mcf in 2019.

The 12-month gas strip price (a simple average of settlement prices for the next 12 months' futures prices) also fell over the month, decreasing from \$7.41/mcf to \$5.70/mcf. The strip price has averaged \$6.09/mcf so far in 2022, having averaged \$3.52 in 2021, \$2.54 in 2020 and \$2.60 in 2019.

Source: Bloomberg LP

Factors which strengthened the US gas price in September included:

• Higher thermal coal prices

Thermal coal prices in the north-east of the US rose again in September, as coal supply is pulled into a strong export market. This in turn has raised the switching price for US utilities between natural gas and coal.

• Lower than normal international gas inventories and stronger international demand

High gas demand and low inventories in Europe and Asia held international gas prices above \$25/mcf during the month. This in turn is maximising demand for exports of LNG from the US. The EIA forecasts that US LNG exports will remain elevated, growing to 13 bcf/day at the end of the year (assuming Freeport LNG returns to service).

Factors which weakened the US gas price in September included:

• Slight growth in onshore gas supply

EIA 914 data released at the start of October indicates that July 2022 onshore gas production in the US grew by around 0.1 Bcf/day, to 107.4 Bcf/day. This takes year-on-year growth in US onshore supply up by around 4.5 Bcf/day (+4.4%).

Market undersupplied (ex-weather effects)

Builds into US natural gas inventories during September were higher than expected for the time of year. Adjusting for the impact of weather, the builds implied that the US gas market was, on average, nearly 1 Bcf/day undersupplied.

Weather adjusted US natural gas inventory injections and withdrawals

reacing begree bays minus cooling begree bays

Source: Bloomberg LP; Guinness Global Investors

Natural gas inventories

Swings in the balance for US natural gas should, in theory, show up in movements in gas storage data. Natural gas inventories at the end of September were reported by the EIA to be 3.0 Tcf. Current gas in storage is around 0.3 Tcf below the 10-year average.

Deviation from 10yr gas storage norm

2. MANAGER'S COMMENTS

Free cashflows in the oil & gas sector

OPEC+ met on October 5 and agreed a headline 2m b/day quota cut, which likely translates into an actual production cut of around 1m b/day. OPEC provided two reasons for the cut: first, a micromanagement of short-term demand weakness, and second, an acknowledgement that the oil market is short of inventories and spare capacity, meaning oil prices need to be higher to incentivise appropriate investment in new capacity. The cuts also demonstrate core OPEC's strong position in the market, defending a higher price than in previous cycles with little prospect of an overwhelming non-OPEC response.

Strong oil prices, alongside high natural gas prices and robust refining margins, have formed a bullish backdrop for company cashflows in the sector, which are well in excess of those generated last year. In general, this continues to translate into low levels of reinvestment, lower levels of debt and a return of free cash to shareholders.

Considering, first, the US exploration and production sector, and after several years of focusing on production growth at the expense of return on capital and free cashflow, the oil & gas industry is demonstrating a meaningful shift towards capital discipline. Nearly all US E&P companies are sticking to the constrained capital reinvestment rates that they laid out at the start of 2022. Generally, we see companies currently spending 35-40% of cashflow on capital spending, which compares to the average reinvestment rate between 2015 and 2019 of around 125%. A lack of new debt being available has contributed to the slowdown in spending, but it has also been driven by the stock market clearly rewarding those E&Ps that are embracing capital restraint over those that have continued to spend.

US E&P sector: capital expenditure as % of cashflow from operations (2010-2023)

Source: Morgan Stanley; Guinness Global Investors

The sector is contending with cost inflation, particularly in areas like the Permian Basin in Texas, where activity has rebounded the most. Companies have noted a lack of service capacity availability, in particular a shortage of new pressure pumping fleets coming into the market, which has pushed unit costs higher by 10-15%. Nevertheless, spending budgets are under control, and this is translating into a major uptick in free cashflow.

Free cashflow yield: US E&P sector vs S&P 500

Source: Morgan Stanley; Guinness Global Investors. Assumes \$95/\$80 WTI in 2022/23

The route by which free cashflow is being returned to shareholders has varied. The approach attracting most attention is the variable dividend, employed over the last 12-18 months by Devon Energy and Pioneer Natural Resources (both in our portfolio). The variable dividend framework, in which a percentage of excess free cashflow beyond base dividends is returned to shareholders, has been received favourably. We see it as providing transparency, clear through-cycle alignment between producers and shareholders, and should tie companies better to being capital disciplined. Other companies, such as EOG Resources, have relied on special dividends as their preferred mechanism for returning cash, though our sense is that there is a preference in the market for a codified rather than discretionary framework.

Looking ahead into next year, and assuming an average WTI price of \$80/bl, we expect that most E&Ps will be looking to grow their production by around 0-5%, which would be consistent with continued capital restraint. Capital expenditure budgets are likely to be higher to achieve that production, but overall free cashflow will be boosted by below market oil prices hedges that will be rolling off for many companies.

For the large integrated oil and gas companies, positive momentum in key macro drivers (oil prices, gas prices, refining margins) have paved the way for higher cash returns. These effects are particularly evident for the European integrated oil & gas companies, where quarterly free cashflow returns this year are likely to be a multiple of the 10-year average historical free cashflow for the group:

European integrateds FCF generation (\$bn)

Source: Goldman Sachs; Guinness Global Investors

In the first half of 2021, the EU integrateds focused on financial de-gearing, but balance sheet strength is now largely complete, with all companies reaching their gearing or net debt targets. The sector has therefore shifted its focus to incremental cash returns to shareholders. Given valuation metrics are depressed versus history, much of the return is coming in the form of share buybacks. Buybacks for the group so far in 2022 (including the third quarter) are estimated to be around \$65bn, almost as much as the buybacks reported in total for the previous four years.

As a group, we see the super-majors now covering their dividend by around two times in 2022, versus only around half cover in 2020. Ongoing capital discipline is supporting the lowest 'oil breakeven price' (i.e. oil price required to cover capex and dividends) in recent history for the group, sitting at around \$45/bl.

Turning to the key holdings in the Guinness Global Energy Fund, and it is clear we have entered a period of higher free cashflows, with an estimated FCF yield next year of 12.6%, as illustrated in the chart below:

Free cash flow yield of key Guinness Energy portfolio holdings (1998-24E)

And considering the key holdings in the portfolio (ex our smaller 'research' positions), we see strong free cashflow yields across most subsectors, but particularly in the upstream:

Source: Bloomberg; Guinness Global Investors. At Sept 30 2022

In the environment described, we expect continued high dividends, share buybacks and a reduction in the debt that remains in the sector.

Source: Bloomberg; Guinness Global Investors. At Sept 30 2022

3. PERFORMANCE Guinness Global Energy Fund

Past performance is not a guide to future returns.

The main index of oil and gas equities, the MSCI World Energy Index (net return), fell by 9.4% in September, while the MSCI World Index (net return) fell by 9.3% in USD.

Within the Fund, September's strongest performers included Sinopec, Conocophillips, Schlumberger, Shell and BP while the weakest performers included, Cenovus, CNQ, Equinor, Suncor and Devon.

Performance (in USD) as at 30.09.2022

The value of this investment and any income arising from it can fall as well as rise as a result of market and currency fluctuations as well as other factors. You may lose money in this investment.

Calculation by Guinness Global Investors, *Simulated past performance prior to 31.3.08, launch date of Guinness Global Energy Fund. The Guinness Global Energy investment team has been running global energy funds in accordance with the same methodology continuously since December 1998. These returns are calculated using a composite of the Investec GSF Global Energy Fund class A to 29.2.08 (managed by the Guinness team until this date); the Guinness Atkinson Global Energy Fund (sister US mutual fund) from 1.3.08 to 31.3.08 (launch date of this Fund), the Guinness Global Energy Fund class A (1.49% OCF) from launch to 02.09.08, and class Y (0.99% OCF) thereafter. Returns for share classes with a different OCF will vary accordingly.

Investors should note that fees and expenses are charged to the capital of the Fund. This reduces the return on your investment by an amount equivalent to the Ongoing Charges Figure (OCF). The fund performance shown has been reduced by the current OCF of 0.99% per annum. Returns for share classes with different OCFs will vary accordingly. Performance returns do not reflect any initial charge; any such charge will also reduce the return.

¹TB Guinness Global Energy Fund

UK investors should be aware that the Guinness Global Energy Fund is available as a UK-domiciled fund denominated in GBP. The TB Guinness Global Energy Fund is available from 0.95% OCF. The historical performance of this fund will differ from the Guinness Global Energy Fund as the TB Guinness Global Energy fund has only been recently brought into line with the Guinness Global Energy Fund. Portfolio holdings

Our integrated and similar stock exposure (c.51%) is comprised of a mix of mid cap, mid/large cap and large cap stocks. Our five large caps are Chevron, BP, ExxonMobil, Royal Dutch Shell and Total. Mid/large and mid-caps are ENI, Equinor, GALP, Repsol and OMV. At September 30 2022 the median P/E ratio of this group was 9.0x 2021 earnings. We also have three Canadian integrated holdings, Suncor, Cenovus and Imperial Oil. All three companies have significant exposure to oil sands in addition to downstream assets.

Our exploration and production holdings (c.24%) give us exposure most directly to rising oil and natural gas prices. We include in this category non-integrated oil sands companies, as this is the GICS approach. The stock here with oil sands exposure is Canadian Natural Resources. The pure E&P stocks have a bias towards the US (EOG, Diamondback, Pioneer and Devon), with one other name (ConocoPhillips) having a mix of US and international production. One of the key metrics behind a number of the E&P stocks held is low enterprise value / proven reserves.

We have exposure to two emerging market stocks, Petrochina and Sinopec, in the portfolio and in total represent around 3% of the portfolio.

The portfolio contains two midstream holdings, Enbridge and Kinder Morgan, two of North America's largest pipeline company. With the growth of hydrocarbon demand expected in the US and Canada over the next five years, we believe both companies are well placed to execute their pipeline expansion plans.

We have reasonable exposure to oil service stocks, which comprise around 7% of the portfolio. The stocks we own are mainly diversified internationally (Helix and Schlumberger).

Our independent refining exposure is currently in the US in Valero, the largest of the US refiners. Valero has a reasonably large presence on the US Gulf Coast and is benefitting from a recovery in refining margins.

Portfolio at August 31 2022 (for compliance reasons disclosed one month in arrears)

Source: Bloomberg; IEA; Guinness Global Investors

Global oil demand in 2019 was 13m b/day higher than the pre-financial crisis (2007) peak. The demand picture for 2020, down by around 9m b/day, was heavily clouded by the impact of the COVID-19 virus and efforts to mitigate its spread. Demand recovered in 2021 by around 6.2m b/day, leaving overall consumption still around 3m b/day below the 2019 peak.

OPEC

The last few years have proved a testing time for OPEC. They have tried to keep prices strong enough that OPEC economies are not running excessive deficits, whilst not pushing the price too high and over-stimulating non-OPEC supply.

The effect of \$100+ bbl oil, enjoyed for most of the 2011-2014 period, emerged in 2014 in the form of an acceleration in US shale oil production and an acceleration in the number of large non-OPEC (ex US onshore) projects reaching production. OPEC met in late 2014 and responded to rising non-OPEC supply with a significant change in strategy to one that prioritised market share over price. Post the November 2014 meeting, OPEC not only maintained their quota but also raised production significantly, up over 18 months by 2.5m b/day. This contributed to an oversupplied market in 2015 and 2016.

In late 2016, faced with sharply lower oil prices, OPEC stepped back from their market share stance, announcing plans for the first production cut since 2008, opting for a new production limit of 32.5m b/day. The announcement included a cut in production from Russia (a non-OPEC country), creating for the first time the concept of an OPEC+ group.

				Current vs	Current vs
('000 b/day)	31-Dec-19	31-Jul-22	31-Aug-22	Dec 2019	last month
Saudi	9,730	10,780	10,960	1,230	180
Iran	2,080	2,520	2,520	440	0
Iraq	4,610	4,420	4,430	-180	10

OPEC-10 oil production to August 2022

Source: Bloomberg; Guinness Global Investors

The 2017-19 period continued to see a volatile time for OPEC with further production cuts necessary to balance ongoing non-OPEC supply growth.

The challenge for OPEC+ then ballooned in 2020 with the onset of COVID around the world. Initially, OPEC and their non-OPEC partners failed to reach agreement around their response to demand from the spread of the virus, precipitating a fall-out between participants and a short-lived price war. In light of extreme oil market oversupply, OPEC and non-OPEC partners reconvened in April 2020 and confirmed a deal to cut their production by 9.7m b/day, relative to their 'baseline' production level of October 2018.

In July 2021, the OPEC+ group agreed to taper their quota cuts at 0.4m b/day until September 2022, whilst still meeting monthly to ratify each production increase in light of the prevailing conditions. The agreement gave us confidence that OPEC was looking to do 'what it takes' to keep the market in balance, despite extreme challenges.

OPEC-10 apparent production vs call on OPEC 2000 – 2023

Source: IEA Oil Market Report (Aug 2022 and prior); Guinness estimates

OPEC's actions in recent years have generally demonstrated a commitment to delivering a reasonable oil price to satisfy their own economies but also to incentivise investment in long term projects. Saudi's actions at the head of OPEC have been designed to achieve an oil price that to some extent closes their fiscal deficit (c.\$75/bl is needed to close the gap fully), whilst not spiking the oil price too high and over-stimulating non-OPEC supply.

In the shorter term, the COVID-19 and Russia crises have created particularly challenging conditions, adding to oil price volatility. Longer term, we believe that Saudi seek a 'good' oil price, one that satisfies their fiscal needs. Overall, we reiterate two important criteria for Saudi:

- 1. Saudi is interested in the average price of oil that they get; they have a longer investment horizon than most other market participants
- 2. Saudi wants to maintain a balance between global oil supply and demand to maintain a price that is acceptable to both producers and consumers

Nothing in the market in recent years has changed our view that OPEC can put a floor under the price – as they did in 2020, 2018, 2016, 2008, 2006, 2001 and 1998.

Supply looking forward

The non-OPEC world has, since the 2008 financial crisis, grown its production more meaningfully than in the seven years before 2008. The growth was 0.9% p.a. from 2001-2008, increasing to 1.8% p.a. from 2008-2019.

Growth in the non-OPEC region since the start of the last decade has been dominated by the development of shale oil and oil sands in North America (up around 7m b/day between since 2010), implying that the rest of non-OPEC region has barely grown over this period, despite the sustained high oil price until mid-2014.

US onshore oil production

Source: EIA; Guinness Global Investors

The growth in US shale oil production, in particular from the Permian basin, raises the question of how much more there is to come and at what price. Our assessment is that US shale oil is a capital-intensive source of oil but one where some growth is viable, on average, at around \$50 oil prices. In particular, there appears to be ample inventory in the Permian basin to allow growth well into the 2020s. The rate of development is heavily dependent on the cashflow available to producing companies, which tends to be recycled immediately into new wells, and the underlying cost of services to drill and fracture the wells. Since 2019, we have seen increased shareholder pressure applied to US E&P companies to improve their capital discipline and to cut their reinvestment rates.

The collapse in oil prices at the start of 2020 to a level well below \$50/bl changed the landscape, with US E&P companies reducing capital spending further as they attempted to live within their cashflows. Despite a stronger oil price since then, the overall reduction in activity caused average US shale supply to decline in 2021. Production growth is returning in 2022, albeit slower than the previous cycle, as the Russia/Ukraine crisis creates greater space again for US shale barrels in the world market.

Non-OPEC supply growth outside the US has been sustained in recent years, despite lower oil prices, with projects that were sanctioned before 2014 (when oil was \$100/bl+) continuing to come onstream. However, with a lack of major project additions post 2020, new supply is only strong enough to offset the decline profiles of existing production, causing overall supply to stagnate.

Demand looking forward

The IEA estimate that 2022 oil demand will rise by around 2.0m b/day to 99.7m b/day, still around 0.9m b/day below the 2019 pre-COVID peak. The spread of the COVID virus globally caused major restrictions to the movement of people, which has now largely reversed, but high prices and slower economic growth are curtailing demand growth in certain sectors.

Post the COVID demand recovery and assuming typical economic growth, we expect the world to settle back into oil demand growth of plus or minus 1m b/day, led by increased use in Asia. Historically, China has been the most important component of this growth and continues to be a major component, although signs are emerging that India will also grow rapidly.

The trajectory of global oil demand over the next few years will be a function of global GDP, pace of the 'consumerisation' of developing economies, the development of alternative fuels and price. At a \$75/bl oil price, the world oil bill as a percentage of GDP is around 3% and this will still be a stimulant of further demand growth. If oil prices persist in a higher range (say around \$100/bl, representing 4% of GDP), we probably return to the pattern established over the past 5 years, with a flatter picture in the OECD more than offset by growth in the non-OECD area. Flatter OECD demand reflects improving oil efficiency over time, dampened by economic, population and vehicle growth. Within the non-OECD, population growth and rising oil use per capita will both play a significant part.

We keep a close eye on developments in the 'new energy' vehicle fleet (electric vehicles; hybrids etc), but see little that makes a significant dent on the consumption of gasoline and diesel in the next few years. Sales of electric vehicles (pure electric and plug-in hybrid electrics) globally were around 6.1m in 2021, up from 3.1m in 2020. We expect to see strong EV sales growth again in 2022, up to around 10m, or 12% of total global sales. Even applying an aggressive growth rate to EV sales, we see EVs comprising only around 2% of the global car fleet by the end of

2022. Looking further ahead, we expect the penetration of EVs to accelerate, causing global gasoline demand to peak at some point in the middle of the 2020s. However, owing to the weight of oil demand that comes from sources other than passenger vehicles (around 70%), which we expect to continue growing linked to GDP, we expect total oil demand not to peak until around 2030.

Conclusions about oil

The table below summarises our view by showing our oil price forecasts for WTI and Brent in 2022 versus recent history.

Average WTI & Brent yearly prices, and changes

Oil price (inflation adjuste	ed)															Est
12 month MAV	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022

Source: Guinness Global Investors, Bloomberg

We believe that Saudi's long-term objective remains to maintain a 'good' oil price, something north of \$75/bl. The world oil bill at around \$75/bl represents 3.0% of 2021 Global GDP, under the average of the 1970 – 2021 period (3.4%).

ii) Natural gas market

US gas demand

On the demand side for the US, industrial gas demand and power generation gas demand, each about 25-30% of total US gas demand, are key. Commercial and residential demand, which make up a further quarter, have been fairly constant on average over the last decade – although yearly fluctuations due to the coldness of winter weather can be marked.

Carry			+:			0-+-	h = = 20	1221

US natural gas demand

Source: Guinness estimates; GS (October 2022)

Industrial demand (of which around 35% comes from petrochemicals) tends to trend up and down depending on the strength of the economy and the differential between US and international gas prices. Electricity gas demand (i.e. power generation) is affected by weather, in particular warm summers which drive demand for air conditioning, but the underlying trend depends on GDP growth and the proportion of incremental new power generation each year that goes to natural gas versus the alternatives of coal, nuclear and renewables. Gas has been taking market share in this sector: in 2021, 33% of electricity generation was powered by gas, up from 22% in 2007. The big loser here is coal which has consistently given up market share.

Total gas demand in 2021 (including Mexican and LNG exports) was around 99.7 Bcf/day, up by 3.7 Bcf/day versus 2020 and 11 Bcf/day (12%) higher than the 5-year average. The biggest contributors to the growth in demand in 2020 were residential/commercial and LNG exports (opening of new export terminals). Power generation for gas was lower, however.

We expect US demand in 2022, assuming prices average around \$5-6/mcf, to be up by around 3 Bcf/day. Looking further ahead to 2025, we believe that gas will take a good share of incremental power generation growth in the US and continue to take market share from coal. Our working assumption is for gas fired power generation to

grow 0.8-1.2 Bcf/day per year, although this will be affected by actual gas prices. Beyond the mid-2020s, we expect power generation from gas to face stronger competition from renewables.

US gas supply

Overall, whilst gas demand in the US has been strong over the past five years, it has been overshadowed by a rise in onshore supply, holding the gas price lower.

The supply side fundamentals for natural gas in the US are driven by three main moving parts: onshore and offshore domestic production, pipeline imports of gas from Canada and LNG imports. Of these, onshore supply is the biggest component, making up over 90% of total supply.

	Sourc	e: Fl	A: GS:	Guinr	iess e	stime	ates

US natural gas supply

Over the last 14 years or so, the weaker gas price in the US reflects growing onshore US production driven by rising shale gas and associated gas production (a by-product of growing onshore US oil production). Interestingly, the overall rise in onshore production has come despite a collapse in the number of rigs drilling for gas, which has dropped from a 1,606 peak in September 2008 to 161 at the end of August 2022. However, offsetting the fall, the average productivity per rig has risen dramatically as producers focus their attention on the most prolific shale basins, whilst associated gas from oil production has grown handsomely.

Source: EIA 914 data (Oct 2022 data)

The outlook for gas production in the US depends on three key factors: the rise of associated gas (gas produced from wells classified as oil wells); expansion of the newer shale basins, principally the Marcellus/Utica, and the decline profile of legacy gas fields.

Associated gas production declined in 2021 with the fall of shale oil production, but will rise again in 2022 as shale oil grows again. Generally, we expect to see rates of around 2-3 Bcf/day of associated gas per 1m b/day of oil production growth. The Marcellus/Utica region, which includes the largest producing gas field in the US and the surrounding region, reached production of around 32 Bcf/day in 2021. Moderate growth is likely in 2022.

Overall, if the price averages in the \$6-7/mcf range, we expect a rise in average onshore gas supply in 2022, up by around 4-5 Bcf/day versus 2021.

Outlook for US LNG exports - global gas arbitrage

The prospects for US LNG exports depend on the differentials to European and Asian gas prices, and whether the economic incentive exists to carry out the trade. The UK national balancing point (NBP) gas price – which serves as a proxy to the European traded gas price – has moved to a significant premium to the US gas price (c.\$25-40/mcf versus c.\$6-8/mcf). Asian spot LNG prices have also been extraordinarily strong, averaging over \$10/mcf in 2021 and up over \$35/mcf on a spot basis at the end of September. There have been many factors at play, in particular the strong post-COVID demand recovery, and a shortage of Russian imports into Europe. The implied economics for US LNG exports into Europe and Asia are attractive assuming international prices are at least \$5/mcf higher than Henry Hub.

International gas prices to Sept 2022

Source: Bloomberg; Guinness Global Investors (Oct 2022)

Relationship with oil and coal

The following chart of the front month US natural gas price against heating oil (No 2), residual fuel oil (No 6) and coal (Sandy Barge adjusted for transport and environmental costs) seeks to illustrate how coal and residual fuel oil switching provide a floor and heating oil a ceiling to the natural gas price. When the gas price has traded below the coal price support level (2012 and 2016), resulting coal to gas switching for power generation was significant.

Source: Bloomberg; Guinness Global Investors (Oct 2022)

Conclusions about US natural gas

The US natural gas price was held back in the 2010s by continued strength in gas supply, particularly from the Marcellus/Utica and from gas produced as a by-product of shale oil. Natural gas prices averaged \$3.71/mcf in 2021, up from \$2.13/mcf in 2020, and we suspect that the (full cycle) marginal cost of supply is now around \$4-5/mcf. More controlled growth in associated gas supply over the next couple of years should allow gas prices to stay closer to the full cycle cost level.

6. APPENDIX Oil and gas markets historical context

Oil price (WTI \$) since 1989

For the oil market, the period since the Iraq Kuwait war (1990/91) can be divided into four distinct periods:

- 1990-1998: broadly characterized by decline. The oil price steadily weakened 1991 1993, rallied between 1994 –1996, and then sold off sharply, to test 20-year lows in late 1998. This latter decline was partly induced by a sharp contraction in demand growth from Asia, associated with the Asian crisis, partly by a rapid recovery in Iraq exports after the UN Oil for food deal, and partly by a perceived lack of discipline at OPEC in coping with these developments.
- 2) 1998-2014: a much stronger price and upward trend. There was a very strong rally between 1999 and 2000 as OPEC implemented 4m b/day of production cuts. It was followed by a period of weakness caused by the rollback of these cuts, coinciding with the world economic slowdown, which reduced demand growth and a recovery in Russian exports from depressed levels in the mid 90's that increased supply. OPEC responded rapidly to this during 2001 and reintroduced production cuts that stabilized the market relatively quickly by the end of 2001.

Then, in late 2002 early 2003, war in Iraq and a general strike in Venezuela caused the price to spike upward. This was quickly followed by a sharp sell-off due to the swift capture of Iraq's Southern oil fields by Allied Forces and expectation that they would win easily. Then higher prices were generated when the anticipated recovery in Iraq production was slow to materialise. This was in mid to end 2003 followed by a much more normal phase with positive factors (China demand; Venezuelan production difficulties; strong world economy) balanced against negative ones (Iraq back to 2.5 m b/day; 2Q seasonal demand weakness) with stock levels and speculative activity needing to be monitored closely. OPEC's management skills appeared likely to be the critical determinant in this environment.

By mid-2004 the market had become unsettled by the deteriorating security situation in Iraq and Saudi Arabia and increasingly impressed by the regular upgrades in IEA forecasts of near record world oil demand growth in 2004 caused by a triple demand shock from strong demand simultaneously from China; the developed world (esp. USA) and Asia ex China. Higher production by OPEC has been one response and there was for a period some worry that this, if not curbed, together with demand and supply responses to higher prices, would cause an oil price sell off. Offsetting this has been an opposite

Source: Bloomberg LP

worry that non-OPEC production could be within a decade of peaking; a growing view that OPEC would defend \$50 oil vigorously; upwards pressure on inventory levels from a move from JIT (just in time) to JIC (just in case); and pressure on futures markets from commodity fund investors.

Continued expectations of a supply crunch by the end of the decade, coupled with increased speculative activity in oil markets, contributed to the oil price surging past \$90 in the final months of 2007 and as high as \$147 by the middle of 2008. This spike was brought to an abrupt end by the collapse of Lehman Brothers and the financial crisis and recession that followed, all of which contributed to the oil price falling back by early 2009 to just above \$30. OPEC's responded decisively and reduced output, helping the price to recover in 2009 and stabilise in the \$70-95 range where it remained for two years.

Prices during 2011-2014 moved higher, averaging around \$100, though WTI generally traded lower than Brent oil benchmarks due to US domestic oversupply affecting WTI. During this period, US unconventional oil supply grew strongly, but was offset by the pressures of rising non-OECD demand and supply tensions in the Middle East/North Africa.

- 3) **2014-2020:** a further downcycle in oil. Ten years of high prices leading up to 2014 catalysed a wall of new non-OPEC supply, sufficient that OPEC saw no choice but to stop supporting price and re-set the investment cycle. Oil prices found a bottom in 2016 (as a result of OPEC and non-OPEC partners cutting production again), but its recovery was capped by the volume of new supply still coming into the market from projects sanctioned pre the 2014 price crash. Average prices were pinned 2017-19 in the \$50-70/bl range, with prices at the top end of this rang stimulating oversupply from US shale. The alliance between OPEC and non-OPEC partners fell apart briefly in March 2020 and, coupled with an unprecedented collapse in demand owing to the COVID-19 crisis, oil prices dropped back below \$30/bl, before recovering to around \$50/bl by the end of 2020 thanks to renewed OPEC+ action.
- 4) **2021-:** Underinvestment in new oil capacity in the 2015-2020 period catalysed the start of a new cycle in 2021, pushing prices above \$75/bl.

North American gas price since 1991 (Henry Hub \$/Mcf)

Source: Bloomberg LP

With regard to the US natural gas market, the price traded between \$1.50 and \$3/Mcf for the period 1991 - 1999. The 2000s were a more volatile period for the gas price, with several spikes over \$8/mcf, but each lasting less than 12 months. On each occasion, the price spike induced a spurt of drilling which brought the price back down. Excepting these spikes, from 2004 to 2008, the price generally traded in the \$5-8 range. Since 2008, the price has averaged below \$4 as progress achieved in 2007-8 in developing shale plays boosted supply while the 2008-09 recession cut demand. Demand has been recovering since 2009 but this has been outpaced by continued growth in onshore production, driven by the prolific Marcellus/Utica field and associated gas as a by-product of shale oil production.

North American gas prices are important to many E&P companies. In the short-term, they do not necessarily move in line with the oil price, as the gas market is essentially a local one. (In theory 6 Mcf of gas is equivalent to 1 barrel of oil so \$60 per barrel equals \$10/Mcf gas). It remains a regional market more than a global market, though the development of the LNG industry is creating a greater linkage.

IMPORTANT INFORMATION

Issued by Guinness Global Investors, a trading name of Guinness Asset Management Limited, which is authorised and regulated by the Financial Conduct Authority.

This report is primarily designed to inform you about recent developments in the energy markets invested in by the Guinness Global Energy Fund. It also provides information about the Fund's portfolio, including recent activity and performance. This document is provided for information only and all the information contained in it is believed to be reliable but may be inaccurate or incomplete; any opinions stated are honestly held at the time of writing, but are not guaranteed. The contents of the document should not therefore be relied upon. It is not an invitation to make an investment nor does it constitute an offer for sale.

Documentation

The documentation needed to make an investment, including the Prospectus, the Key Investor Information Document (KIID) and the Application Form, is available in English from www.guinnessgi.com or free of charge from:-

- the Manager: Link Fund Manager Solutions (Ireland) Ltd (LFMSI), 2 Grand Canal Square, Grand Canal Harbour, Dublin 2, Ireland; or,
- the Promoter and Investment Manager: Guinness Asset Management Ltd, 18 Smith Square, London SW1P 3HZ.

LFMSI, as UCITS Man Co, has the right to terminate the arrangements made for the marketing of funds in accordance with the UCITS Directive

Investor Rights

A summary of investor rights in English is available here:
