

RISK

This is a marketing communication. Please refer to the prospectuses, KIDs and KIIDs for the Funds, which contain detailed information on their characteristics and objectives, before making any final investment decisions.

The Funds are equity funds. Investors should be willing and able to assume the risks of equity investing. The value of an investment and the income from it can fall as well as rise as a result of market and currency movement, and you may not get back the amount originally invested. Further details on the risk factors are included in the Funds' documentation, available on our website.

Past performance does not predict future returns.

ABOUT THE STRATEGY

Launch	31.12.1998
Index	MSCI World Energy
Sector	IA Commodity/Natural Resources
Managers	Will Riley Jonathan Waghorn Tim Guinness
EU Domiciled	Guinness Global Energy Fund
UK Domiciled	WS Guinness Global Energy Fund

INVESTMENT POLICY

The Guinness Global Energy Funds invest in listed equities of companies engaged in the exploration, production and distribution of oil, gas and other energy sources. We believe that over the next twenty years the combined effects of population growth, developing world industrialisation and diminishing fossil fuel supplies will force energy prices higher and generate growing profits for energy companies. The Funds are actively managed and use the MSCI World Energy Index as a comparator benchmark only.

COMMENTARY

OIL

Prices rise on tighter supply/demand and ME tensions

Brent and WTI spot oil prices were up \$2/bl and \$5/bl in March as oil supply/demand fundamentals tightened, Middle Eastern tensions continued and OPEC+ production compliance generally remained good. Five-year forward prices were up by around \$1/bl, with Brent closing March at \$70/bl and WTI at \$65/bl.

NATURAL GAS

Global gas prices lower on exceptionally mild winter

Asian and European gas prices (using UK national balancing point) ended March around \$1/mcf higher, both trading around \$9-10/mcf, whilst the US spot price (Henry Hub) fell from \$1.9/mcf to \$1.8/mcf. The US has experienced its warmest winter on record, with temperatures 3 degrees (Celsius) higher than the 20th Century average, causing a sharp reduction in heating demand.

EQUITIES

Energy outperforms the broad market in March

The MSCI World Energy Index (net return) increased by 9.1% in March, outperforming the MSCI World Index (net return) which rose by 3.0% (all in USD). Year-to-date, the MSCI World Energy Index is up by 9.8% versus the MSCI World Index up by 8.9%.

CHART OF THE MONTH

Oil & gas companies showing cleaned up balance sheets

The focus by oil & gas producers on capital expenditure discipline and higher free cashflow generation has allowed companies to pay down debt. Average net debt to EBITDA (earnings before interest, tax, appreciation and amortisation) amongst energy companies in the S&P1500, for example, sits at about half of the 15-year average, and is allowing higher cash distributions to be achieved, as little additional debt paydown is needed.

S&P1500 Energy net debt/EBITDA

MARCH IN REVIEW

i) Oil market

Oil price (WTI and Brent \$/barrel): September 2022 to March 2024

Source: Bloomberg; Guinness Global Investors

The West Texas Intermediate (WTI) oil price began March at \$78/bl and rose gradually throughout, closing at \$83/bl. WTI has averaged \$77/bl so far this year, having averaged \$78/bl in 2023 and \$95/bl in 2022. Brent oil traded in a similar shape, opening at \$85/bl and closing up at nearly \$87/bl. Brent has averaged just over \$83/bl so far in 2024, having averaged \$83/bl in 2023 and \$100/bl in 2022. The gap between the WTI and Brent benchmark oil prices closed over the month, ending March at \$3.8/bl. The Brent-WTI spread has averaged \$6.0/bl so far in 2024 after averaging \$5.0/bl in 2023.

Factors which strengthened WTI and Brent oil prices in March:

- **Overall tighter supply/demand environment**

Recent inventory declines suggest the oil market has been tighter than expected in the start of 2024. Oil inventories have estimated to have drawn by c.1m b/day in February (latest data), partly driven by lower-than-expected OPEC supply which has been brought by better-than-expected compliance. In addition, US production has underperformed (partially driven by weather effects) while demand growth appears robust and flight schedules suggest stronger jet fuel demand this summer.

- **Middle East conflict / Iranian sanction concerns**

Tensions in the Middle East ratcheted higher in March, whilst at the start of April, Israel's air strike on Iran's embassy in Syria raised concerns that Iran could become directly involved in the conflict. Latest data suggests that Iran is producing around 3.2m b/day of oil, up significantly from twelve months ago. Any disruption to Iranian oil exports would clearly have a tightening effect on the world market.

- **Higher bunker fuel demand**

Houthi rebel attacks on commercial ships south of Yemen has led to the rerouting of vessels away from the Suez Canal and south of the Cape of Good Hope. Longer shipping routes have raised demand for bunker (ship) fuel, up globally by an estimated 0.1m b/day versus last year. Singapore, the chief global centre for maritime refuelling due to its strategic location on the Straits of Malacca, the world's busiest shipping lane, has seen bunker sales reach all-time highs.

Factors which weakened WTI and Brent oil prices in March:

- Weaker Chinese macro**

Although China is likely to remain the biggest driver of global oil consumption growth in 2024, weak manufacturing data and consumer expenditure data bring into question the scale of demand growth. Chinese oil demand is currently forecast to grow by 0.6m b/day in 2024 to 17.0m b/day, a slight downgrade (-0.1m b/day) versus the previous month.

Speculative and investment flows

The New York Mercantile Exchange (NYMEX) net non-commercial crude oil futures open position was 278,000 contracts long at the end of March versus 225,000 contracts long at the end of February. The net position peaked in February 2018 at 739,000 contracts long. Typically, there is a positive correlation between the movement in net position and movement in the oil price. The gross short position decreased to 99,000 contracts at the end of March versus 129,000 at the end of the previous month.

NYMEX Non-commercial net and short futures contracts: WTI January 2004 – March 2024

Source: Bloomberg LP/NYMEX/ICE (2024)

OECD stocks

OECD total product and crude inventories at the end of February (latest data point) were estimated by the International Energy Agency (IEA) to be 2,734m barrels, down by 24m barrels versus the level reported for the previous month. The fall in February compares to a 10-year average draw of 16m barrels, implying that the OECD market was about 0.3m b/day undersupplied. The significant oversupply situation in 2020 pushed OECD inventory levels close to maximum capacity in August 2020 (c3.3bn barrels), with subsequent tightening taking inventories below normal levels.

OECD total product and crude inventories, monthly, 2010 to February 2024

Source: IEA Oil Market Reports (March 2024 and older)

ii) Natural gas market

The US natural gas price (Henry Hub front month) opened March at \$1.86/mcf (1,000 cubic feet) and traded steadily lower during the month, down to \$1.56/mcf, before rallying to close the month at \$1.76/mcf. The spot gas price has averaged \$2.11/mcf so far in 2024, having averaged \$2.67/mcf in 2023 and \$6.52/mcf in 2022.

The 12-month gas strip price (a simple average of settlement prices for the next 12 months' futures prices) traded in a similar pattern, opening at \$2.78/mcf, trading lower to \$2.66/mcf mid-month, before rallying to close back at \$2.78/mcf. The strip price has averaged \$2.74/mcf so far in 2024, having averaged \$3.19 in 2023 and \$5.90 in 2022.

Henry Hub gas spot price and 12m strip (\$/Mcf): August 2022 to March 2024

Source: Bloomberg LP

Factors which strengthened the US gas price in March included:

- Falling rig count**

The number of rigs drilling for natural gas in the US has fallen from 160 rigs in the middle of 2022 to 112 rigs at the end of March 2024. This has slowed gas production growth, though 'associated gas' production (a byproduct of shale oil) has continued to grow this year from the Permian basin.

- Gas E&P companies react to lower prices**

In full year results, many gas-oriented exploration and production (E&P) companies announced slight reductions in activity and production in reaction to low natural gas prices. Chesapeake made the most significant announcement, indicating that it would reduce the number of wells that it brings into production by 70% vs 2023 levels, thereby reducing 2024 net production by around 1 Bcf/day.

Factors which weakened the US gas price in March included:

- Rising onshore production**

Despite the fall in the gas drilling rig count since 2022, US production rose by just over 3.0 Bcf/day in 2023 to 100.9 Bcf/day and is expected to grow to 101.7 Bcf/day in 2024. Production in December 2023 was almost 8 Bcf/day higher than December 2022 meaning that the overall rise in supply has outpaced demand growth over this period.

- Exceptionally warm winter conditions**

The 2023/24 winter in the US was the warmest ever recorded, dampening heating demand for natural gas. According to the National Oceanic and Atmospheric Administration, the average temperature in the lower 48 US states from December 2023 to February 2024 was 3.1 degrees Celsius, the highest in a record that goes back to the 1890s, and 3 degrees above the 20th century average.

• **Market oversupplied (ex-weather effects)**

Adjusting for the impact of weather, the US gas market was, on average, around 0.5 Bcf (billion cubic feet) per day oversupplied during March.

Weather-adjusted US natural gas inventory injections and withdrawals

Source: Bloomberg LP; Guinness Global Investors, to April 1 2024

Natural gas in inventories in the US

US natural gas inventories have been running higher than seasonal norms, driven by a warmer-than-expected winter and early spring that has brought lower-than-expected heating demand. Inventories levels have moved above the 5-year average, ending March at just under 2.3 trillion cubic feet (around 0.6 Tcf above the 10-year average).

Deviation from 10yr US gas storage norm

MANAGERS' COMMENTS

Global energy equities outperformed the broader market over the first quarter of 2024, driven by higher oil prices and exceptional levels of free cashflow from many companies in the sector. Here, we explore the key developments in energy markets and the fund over the period, and consider the outlook.

Over the first three months of 2024, we saw expectations develop of a tighter oil market for the rest of the year than previously forecasted. The tighter oil balance has been driven by a mix of higher demand forecasts and lower supply, amplified by heightened geopolitical tensions in the Middle East and Russia. The Brent spot oil price has risen 16% since the start of the year, whilst the 5-year forward Brent oil price has increased by 5%.

Brent spot price vs 5-year forward price (\$/b) YTD

Source: Bloomberg; Guinness Global Investors

Global oil demand in 2024 was originally forecasted by the IEA to be up by 0.8m b/day versus 2022, putting demand around 1.8m b/day ahead of the pre-COVID peak of 2019. Today, the forecast for 2024 demand growth has been upgraded to 1.3m b/day, a function of higher GDP growth and aviation activity than previously expected. Within the demand mix, petrochemical feedstocks, including ethane and naphtha, are proving to be key growth drivers.

Aviation is a key driver of demand growth which we have been watching closely. The number of global commercial flight departures daily at the end of March is at a seasonal all-time high. Global commercial flights are now 12% above the 2019 level and up by 9% over last year. Global flight schedules are implying meaningfully higher jet fuel consumption over summer 2024, potentially breaching the 8m b/day level (up around 0.2m b/day of estimates made at the start of the year).

Global commercial flights per day vs 2019 (%)

Source: FlightRadar; DNB

When writing at the start of the year about the prospects for oil demand, we placed strong emphasis on the current affordability of oil as a driver of demand upgrades. Globally, we believe that oil remains a 'good value' commodity. Based on a Brent oil price of around \$80/b in 2024, we calculate that the world would spend around 2.8% of GDP on oil, below the

30-year average of around 3% and well below the 3.8% seen in 2010, when oil also averaged \$80/bl. Even oil averaging, say, \$110/bl in 2024, which would represent 3.8% of 2024 GDP, would not have a noticeable negative impact on the global economy.

The world oil 'bill' as a percentage of world GDP

Source: Bloomberg; Guinness Global Investors, March 2024

On the **supply side**, forecasts for non-OPEC supply growth in 2024 have been trimmed since the start of the year. In particular, US onshore supply looks to be coming in lower than expected, thanks to ‘wellhead freeze-offs’ in January (severe cold weather shutting in production), plus the decline in rig count through 2023 starting to have greater impact.

Considering non-OPEC supply on a longer-term basis, and we were pleased to see the exploration results that Galp (a portfolio holding) reported in offshore Namibia during the quarter. Galp confirmed in January that they had made a “significant” discovery of light oil, located close to discoveries made by Shell and TotalEnergies (also portfolio holdings) last year.

At the start of March, the OPEC+ group confirmed their commitment to a good market balance in 2024 with an extension of their first-quarter production levels until at least the end of June. Compliance with current production quotas has generally been good, though both Iraq and Kazakhstan have been pumping at higher than anticipated levels. Both countries have pledged to implement deeper production cuts in the coming months to compensate.

Geopolitical concerns have also come to the fore this year with an escalation of conflict in the Middle East. The most relevant concern from an oil market perspective is the attacks since December by Iranian-backed Houthis on dozens of commercial ships with drones and missiles, leading to the rerouting of container ships to avoid the Suez Canal. Around 8-9m b/day of crude oil and oil product normally flows through the Red Sea and Bab al-Mandab Strait, but much is now being diverted around Africa.

With US/Iranian tensions rising, there is also the concern around the accessibility of the Strait of Hormuz, a 21-mile-wide stretch of water separating Iran from the UAE and Oman. Since typically around 20% of world oil supply passes through the Strait each day, any closure would bring significant disruption to the world oil balance. The current unrest may also result in the US enforcing existing sanctions against Iranian oil exports, in contrast to the last 12 months when Iranian supply has been allowed to re-enter the world market.

International and US natural gas markets have remained looser so far in 2024, thanks largely to exceptionally mild seasonal conditions. In Europe, for example, warmer weather this winter has lowered heating demand for natural gas and kept inventory levels well above the seasonal norm. European gas inventories currently stand around 15% above normal levels, putting the region in a comfortable place to get through the rest of winter with adequate gas in storage. Over the quarter, European gas prices (using UK NBP as a proxy) declined by 17%, whilst US Henry Hub spot gas fell by 30%.

Guinness Global Energy

European gas inventories (% of max)

Source: DNB, March 2024

For companies operating in the key sectors held in the Guinness Global Energy Fund, the consistent themes being reported were operating cost control, CAPEX restraint and an abundance of free cash generation.

Following the proposed acquisition of one of our exploration and production holdings, Pioneer Natural Resources, by Exxon late last year, the most significant piece of M&A so far this year in the portfolio has been Diamondback Energy's acquisition of private Permian E&P company Endeavor. The deal, well received by the stock market, will allow Diamondback to create a broader and more contiguous asset base which will allow more efficient drilling and production.

Within the portfolio over the quarter, the strongest performers included:

- **Canadian integrateds:** Holdings such as Canadian Natural Resources and Imperial Oil benefiting from operational leverage to rising oil prices, and a narrowing of the differential between Canadian and US oil benchmarks.
- **US exploration and production companies:** Also with good leverage to rising oil prices, plus well received M&A for Diamondback Energy, as described above.
- **US refining:** Tighter refining capacity, especially with outages in Russia, drove refining margins higher. Particular beneficiaries included Valero Energy and US major, Exxon.

Sectors in the portfolio that were relatively weaker over the quarter included:

- **International natural gas:** Equinor, which supplies around one third of North West Europe's gas needs, was a notable laggard, reflecting the decline in European gas prices since the start of the year.
- **Midstream:** Pipeline companies Enbridge and Kinder Morgan underperformed, due to lower leverage to rising oil prices than most other parts of the portfolio.

Guinness Global Energy

Moves in energy equities so far this year have lifted the price-to-book (P/B) ratio for the energy sector at the end of March 2024 to around 1.9x, versus the S&P 500 trading at 4.8x. On a relative P/B basis versus the S&P500, therefore, the valuation of energy equities now sits at around 0.4x (down from 0.51x at the end of 2022), and still more than two standard deviations below the long-term relationship.

P/B of energy sector versus S&P 500

Sources: Bernstein; Bloomberg; Guinness Global Investors, March 2024

We keep a close eye on the relationship between the P/B ratio for the energy sector and return on capital employed (ROCE), which historically show high correlation.

ROCE for the Guinness Global Energy portfolio in 2024 (assuming an average Brent oil price of \$80/bl) will be around 12%, we think, a little above mid-cycle ROCE, which we peg at around 11%. However, current valuation implies that the ROCE of our companies will stay at about 4-6%. If ROCE remains at around 12% and the market were to pay for it sustainably, it would imply an increase in the equity valuation of around 30-40%:

ROCE of current Guinness Energy portfolio

ROCE vs P/B multiple for Guinness Energy portfolio

Sources: Bernstein; Bloomberg; Guinness Global Investors

The higher ROCE is being supported by robust free cash generation. Assuming an average Brent oil price of \$80/bl in 2024, we estimate the free cashflow yield of our portfolio, after capital expenditure, to be around 11% and note that the 2024 estimated gross dividend yield of the portfolio currently sits at around 4.1%. Fixed dividends in the portfolio have generally been growing, and have ample room to run further, given the high free cashflow yield.

Guinness Global Energy

Another manifestation of high free cash generation is that companies in the sector generally have balance sheets that appear to be in excellent shape. The focus by oil & gas producers on CAPEX discipline and higher free cashflow generation has allowed companies to pay down debt. Average net debt to EBITDA amongst energy companies in the S&P1500, for example, sits at about half of the 15-year average, and is allowing higher cash distributions to be achieved, as little additional debt paydown is needed.

S&P1500 Energy free cashflow margins

S&P1500 Energy net debt/EBITDA

Source: Morgan Stanley, March 2024

To consider valuation another way, we are often asked what oil price is implied in the portfolio, as a barometer of the expectation priced into the equities. At the end of March, we estimate that the valuation of our portfolio of energy equities reflected a long-term Brent/WTI oil price of around \$68/bl. If the market were to price in a long-term oil price of \$75/bl, it would imply around 25% upside while there would be around 55% upside at a long-term oil price of \$85/bl Brent (which is equivalent to \$57 in 2007 prices):

Upside/downside for Guinness energy portfolio (1-year forward view)

Source: Guinness Global Investors, March 2024

In summary, at \$80/bl Brent in 2024, our portfolio continues to trade at a significant valuation discount to the broader equity market, despite high shareholder return yields. We see good confidence that dividends can continue to increase and will be supplemented by share buyback programmes, all driven by a free cash flow yield of around 11% for the portfolio, much higher than the 3.5% seen in the portfolio over the last 20 years.

PERFORMANCE

The main index of oil and gas equities, the MSCI World Energy Index (net return), increased by 9.1% in March, while the MSCI World Index (net return) rose by 3.0% in USD.

Within the portfolio, March's strongest performers included Valero Energy, Helix Energy, Cenovus, Devon Energy and Schlumberger while the weakest performers included Sinopec, Enbridge Kinder Morgan, ENI and Galp Energia.

Past performance does not predict future returns.

Portfolio holdings

Our integrated and similar stock exposure (c.53%) is comprised of a mix of mid-cap, mid/large-cap and large-cap stocks. Our five large-caps are Chevron, BP, ExxonMobil, Shell and TotalEnergies. Mid/large and mid-caps are ENI, Equinor, GALP, Repsol and OMV. At March 31 2024 the median P/E ratio of this group was 8.0x 2024 earnings. We also have three Canadian integrated holdings, Suncor, Cenovus and Imperial Oil. All three companies have significant exposure to oil sands in addition to downstream assets.

Our exploration and production holdings (c.24%) give us exposure most directly to rising oil and natural gas prices. We include in this category non-integrated oil sands companies, as this is the GICS approach. The stock here with oil sands exposure is Canadian Natural Resources. The pure E&P stocks have a bias towards the US (EOG, Diamondback, Pioneer and Devon), with one other name (ConocoPhillips) having a mix of US and international production. One of the key metrics behind a number of the E&P stocks held is low enterprise value / proven reserves.

We have exposure to two emerging market stocks, Petrochina and Sinopec, which in total represent around 3.8% of the portfolio.

The portfolio contains two midstream holdings, Enbridge and Kinder Morgan, two of North America's largest pipeline companies. With the growth of hydrocarbon demand expected in the US and Canada over the next five years, we believe both companies are well placed to execute their pipeline expansion plans.

Guinness Global Energy

We have reasonable exposure to oil service stocks, which comprise nearly 10% of the portfolio. The stocks we own provide exposure to both North American and international oil and natural gas development.

Our independent refining exposure is currently in the US in Valero, the largest of the US refiners. Valero has a reasonably large presence on the US Gulf Coast and is benefitting from a recovery in refining margins.

Portfolio at February 29 2024 (for compliance reasons disclosed one month in arrears)

Source: Bloomberg; IEA; Guinness Global Investors, April 2024

Global oil demand in 2019 was 13m b/day higher than the pre-financial crisis (2007) peak. The demand picture for 2020, down by around 9m b/day, was heavily clouded by the impact of the COVID-19 virus and efforts to mitigate its spread. Demand rebounded between 2021 and 2023 by over 10m b/day, leaving overall consumption in 2023 over 1m b/day higher than the 2019 peak.

OPEC

The last few years have proved testing for OPEC. They have tried to keep prices strong enough that OPEC economies are not running excessive deficits, whilst not pushing the price too high and over-stimulating non-OPEC supply.

The effect of \$100+/bl oil, enjoyed for most of the 2011-2014 period, emerged in 2014 in the form of an acceleration in US shale oil production and an acceleration in the number of large non-OPEC (ex US onshore) projects reaching production. OPEC met in late 2014 and responded to rising non-OPEC supply with a significant change in strategy to one that prioritised market share over price. Post the November 2014 meeting, OPEC not only maintained their quota but also raised production significantly, up by 2.5m b/day over the subsequent 18 months. This contributed to an oversupplied market in 2015 and 2016.

In late 2016, faced with sharply lower oil prices, OPEC stepped back from their market share stance, announcing plans for the first production cut since 2008. The announcement included a cut in production from Russia (a non-OPEC country), creating for the first time the concept of an OPEC+ group. Late in 2023, Angola announced its intention to leave OPEC.

OPEC-9 oil production to February 2024

('000 b/day)	31-Dec-19	31-Jan-24	29-Feb-24	Current vs Dec 2019	Current vs last month
Saudi	9,730	8,940	8,950	-780	10
Iran	2,080	3,120	3,070	990	-50
Iraq	4,610	4,200	4,160	-450	-40
UAE	3,040	3,130	3,140	100	10
Kuwait	2,710	2,440	2,430	-280	-10
Nigeria	1,820	1,490	1,520	-300	30
Venezuela	730	820	850	120	30
Libya	1,110	1,020	1,140	30	120
Algeria	1,010	900	910	-100	10
OPEC-9	26,840	26,060	26,170	-670	110

Source: Bloomberg; Guinness Global Investors

The 2017-19 period continued to be volatile for OPEC, with further production cuts necessary to balance ongoing non-OPEC supply growth.

The challenge for OPEC+ then ballooned in 2020 with the onset of COVID around the world. Initially, OPEC and their non-OPEC partners failed to reach agreement around their response to demand from the spread of the virus, precipitating a fall-out between participants and a short-lived price war. In light of extreme oil market oversupply, OPEC and non-OPEC partners reconvened in April 2020 and confirmed a deal to cut their production by nearly 10m b/day.

In July 2021, with demand largely recovered after COVID, the OPEC+ group agreed to taper their quota cuts at 0.4m b/day each month until September 2022. The actions of OPEC through the pandemic gave us confidence that OPEC was looking to do 'what it takes' to keep the market in balance, despite extreme challenges. Since the end of 2022, OPEC have adjusted their production to match closely the prevailing call on the group.

OPEC-9 apparent production vs call on OPEC 2000 – 2024

Source: IEA Oil Market Report (Feb 2024 and prior); Guinness estimates

OPEC’s actions in recent years have generally demonstrated a commitment to delivering a reasonable oil price to satisfy their own economies but also to incentivise investment in long-term projects. Saudi’s actions at the head of OPEC have been designed to achieve an oil price that to some extent closes their fiscal deficit (c.\$85/bl is needed to close the gap fully), whilst not spiking the oil price too high and over-stimulating non-OPEC supply.

In the shorter term, the COVID-19 and Russia/Ukraine crises have created particularly challenging conditions, adding to oil price volatility. Longer-term, we believe that Saudi seek a ‘good’ oil price, one that satisfies their fiscal needs. Overall, we reiterate two important criteria for Saudi:

1. Saudi is interested in the average price of oil that they get; they have a longer investment horizon than most other market participants.
2. Saudi wants to maintain a balance between global oil supply and demand to maintain a price that is acceptable to both producers and consumers.

Nothing in the market in recent years has changed our view that OPEC can put a floor under the price – as they did in 2020, 2018, 2016, 2008, 2006, 2001 and 1998.

Supply looking forward

The non-OPEC world has, since the 2008 financial crisis, grown its production more meaningfully than in the period before 2008. The growth was 0.9% p.a. from 2001-2008, increasing to 1.6% p.a. from 2009-2023.

Growth in the non-OPEC region since the start of the last decade has been dominated by the development of shale oil and oil sands in North America (up around 8m b/day between since 2010), implying that the rest of the non-OPEC region has barely grown over this period, despite the sustained high oil price until mid-2014.

US onshore oil production

Source: EIA; Guinness Global Investors, March 2024

The growth in US shale oil production, especially the Permian Basin, raises the question of how much more there is to come and at what price. Our assessment is that US shale oil is capital-intensive but some growth is viable, on average, at around \$70 oil prices. In particular, there appears to be ample inventory in the Permian Basin to allow growth into the mid-2020s. The rate of development is heavily dependent on the cashflow available to producing companies, which tends to be recycled immediately into new wells, and the underlying cost of services to drill and fracture the wells. Since 2019, we have seen increased shareholder pressure applied to US E&P companies to improve their capital discipline and to cut their reinvestment rates.

The collapse in oil prices at the start of 2020 to a level well below \$50/bl changed the landscape, with US E&P companies reducing capital spending further as they attempted to live within their cashflows. Shale oil production dropped by nearly 3m b/day in 2020 (peak to trough) and took nearly three years to recover to the previous peak of late 2019.

Non-OPEC supply growth outside the US has been sustained in recent years, despite lower oil prices, with projects that were sanctioned before 2014 (when oil was \$100/bl+) continuing to come onstream. However, with a lack of major project additions post 2020, new supply growth has proved to be on the slow side.

Future demand

The IEA estimate that 2024 oil demand will rise by around 1.3m b/day to 103.2m b/day, around 2.5m b/day ahead of the 2019 pre-COVID peak.

Post the COVID demand recovery and assuming typical economic growth, we expect the world to settle back into annual oil demand growth of plus or minus 1m b/day, led by increased use in the non-OECD region. China has been, and continues to be, the most important component of this growth, although signs are emerging that India will also grow rapidly.

The trajectory of global oil demand over the next few years will be a function of global GDP, the pace of the ‘consumerisation’ of developing economies, the development of alternative fuels, and price. At \$80/bl, the world oil bill as a percentage of GDP is around 2.8%, and this will still be a stimulant of further demand growth. If oil prices were in a higher range (say around \$110/bl, representing 3.8% of GDP), we would probably return to the pattern established over the past five years, with a flatter picture in the OECD more than offset by growth in the non-OECD area. Flatter OECD demand reflects improving oil efficiency over time, dampened by economic, population and vehicle growth. Within the non-OECD, population growth and rising oil use per capita will both play a significant part.

We keep a close eye on developments in the ‘new energy’ vehicle fleet (electric vehicles; hybrids etc). Sales of electric vehicles (pure electric and plug-in hybrid electrics) globally were around 14m in 2023, up from 10m in 2022 and 6m in 2021. We expect to see strong EV sales growth again in 2024, up to over 16m, around 20% of total global sales. Even applying an aggressive growth rate to EV sales, we see EVs comprising only around 3-4% of the global car fleet by the end of 2024. Looking further ahead, we expect the penetration of EVs to accelerate, causing global gasoline demand to peak at some point in the middle of the 2020s. However, owing to the weight of oil demand that comes from sources other than passenger vehicles (around 75%), which we expect to continue growing linked to GDP, we expect total oil demand not to peak until around 2030.

Conclusions about oil

The table below summarises our view by showing our oil price forecasts for WTI and Brent in 2024 versus recent history.

Average WTI & Brent yearly prices, and changes

Oil price	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	Est

Source: Guinness Global Investors estimates, Bloomberg, January 2024

We believe that Saudi’s long-term objective remains to maintain a ‘good’ oil price, something north of \$80/bl. The world oil bill at around \$80/bl represents 2.8% of 2024 global GDP, well under the average of the 1970 – 2021 period (3.4%).

ii) Natural gas market

US gas demand

On the demand side for the US, industrial gas demand and power generation gas demand (each about 25-35% of total US gas demand) are key. Commercial and residential demand, which make up a further quarter, have been fairly constant on average over the last decade – although yearly fluctuations due to the severity of winter weather can be marked.

Guinness Global Energy

US natural gas demand

Bcf/day	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023E	2024E

Source: EIA; GS; Guinness estimates, April 2024

Industrial demand (of which around 35% comes from petrochemicals) trends up and down depending on the strength of the economy and the differential between US and international gas prices. Electricity gas demand (i.e. power generation) is affected by weather, in particular by warm summers, which drive demand for air conditioning, but the underlying trend depends on GDP growth and the proportion of incremental new power generation each year that goes to natural gas versus the alternatives of coal, nuclear and renewables. Gas has been taking market share in this sector: in 2022 38% of electricity generation was powered by gas, up from 22% in 2007. The big loser here is coal, which has consistently given up market share.

Total gas demand in 2023 (including Mexican and LNG exports) was around 106.9 Bcf/day, up by 1.2 Bcf/day versus 2022 and 7 Bcf/day (7%) higher than the 5-year average. The biggest contributors to the growth in demand in 2023 were LNG exports and power generation.

We expect a more muted US demand growth picture in 2024 of 0.5 Bcf/day versus average growth of nearly 4 Bcf/day between 2021 and 2023. Growth is expected to be driven by higher LNG exports and a strong US economy lifting residential, commercial and industrial demand, offset by declining power generation demand (-2.2 Bcf/day). Beyond 2024, we expect to see a material increase in US LNG export capacity as higher international gas prices incentivise new LNG export investment. Proposed projects imply capacity growth of around 6-7 Bcf/day by the end of 2025 and a further 5-6 Bcf/day in 2026-2028, bringing total export capacity to around 25 Bcf/day by 2028.

US gas supply

Overall, whilst gas demand in the US has been strong over the past five years, it has been overshadowed by a rise in onshore supply, holding the gas price lower.

The supply side fundamentals for natural gas in the US are driven by three main moving parts: onshore and offshore domestic production, pipeline imports of gas from Canada, and LNG imports. Of these, onshore supply is the biggest component, making up over 90% of total supply.

Guinness Global Energy

US natural gas supply

Since 2010, the weaker gas price in the US reflects growing onshore US production driven by rising shale gas and associated gas production (a by-product of growing onshore US oil production). Interestingly, the overall rise in onshore production has come despite a collapse in the number of rigs drilling for gas, which has dropped from a 1,606 peak in September 2008 to a trough of 68 in July 2020, before recovering to around 112 at the end of March 2024. However, offsetting the fall, the average productivity per rig has risen dramatically as producers focus their attention on the most prolific shale basins, whilst associated gas from oil production has grown handsomely.

US natural gross gas production 2010 – 2023 (Lower 48 States)

Source: EIA 914 data (April 2024 data)

The outlook for gas production in the US depends on three key factors: the rise of associated gas (gas produced from wells classified as oil wells); expansion of the newer shale basins, principally the Marcellus/Utica, and the decline profile of legacy gas fields.

Associated gas production is expected to rise again in 2024 albeit at a slower pace (+0.8 Bcf/day) than in 2022 (+5.5 Bcf/day) and 2023 (+3.6 Bcf/day). Lower supply growth is expected from onshore properties as weaker natural gas prices have brought a lower rig count (down 25% to 119 rigs at end January 2024) and lower investment. A 10% reduction in rig count in the Permian also has a knock-on effect of reducing associated gas supply in 2024 while Haynesville production in 2024 may be down versus 2023.

Outlook for US LNG exports – global gas arbitrage

We expect the LNG market is going to be quite finely balanced over the next couple of years. In the event of moderate Chinese LNG demand and “normal” European winters, LNG supply and demand appear to be roughly in balance and global LNG prices appear to be fairly priced at around \$12/mcf. However, stronger Asian demand (including South Korea and Japan as well as China) or a colder than expected European winter could easily see LNG in tight supply and cause international gas prices spike, although it is unlikely that they revert to the \$40-\$50 levels seen in winter 2022/2023.

Guinness Global Energy

Looking further ahead, we see international gas prices settling in a \$10-12/mcf range. This price range should be sufficient to incentivise new US LNG supply to come online from 2025. It would also allow Europe to displace permanently almost all its Russian gas imports. An international gas price in the \$10-12/mcf is well down on the highs seen in 2022, but would leave the market at a c.50% higher price point than that seen in the few years prior to COVID and the Russian invasion of Ukraine.

Relationship with oil and coal

The following chart of the front month US natural gas price against heating oil (No 2), residual fuel oil (No 6) and coal (Sandy Barge adjusted for transport and environmental costs) seeks to illustrate how coal and residual fuel oil switching provide a floor and heating oil a ceiling to the natural gas price. When the gas price has traded below the coal price support level (2012 and 2016), resulting coal-to-gas switching for power generation was significant.

Natural gas versus substitutes (fuel oil and coal) - Henry Hub vs residual fuel oil, heating oil, Sandy Barge (adjusted) and Powder River coal (adjusted)

Conclusions about US natural gas

The US natural gas price since 2010 has mainly fluctuated between \$2 and \$4/mcf. The extremes of this range have tended to coincide with warm and cold winters, and any sustained recovery over \$3.50/mcf has generally been muted by strength in gas supply. With inflationary pressures, we estimate that new onshore supply has an incentive price of around \$3.50/mcf. Assuming normal weather in 2024, we expect a Henry Hub price at around this level.

APPENDIX: Oil and gas markets historical context

Source: Bloomberg, April 2024

For the oil market, the period since the Iraq/Kuwait war (1990/91) can be divided into four distinct periods:

- 1) **1990-1998:** broadly characterized by decline. The oil price steadily weakened 1991 – 1993, rallied between 1994 – 1996, and then sold off sharply, to test 20-year lows in late 1998. This latter decline was partly induced by a sharp contraction in demand growth from Asia, associated with the Asian crisis, partly by a rapid recovery in Iraq exports after the UN Oil for food deal, and partly by a perceived lack of discipline at OPEC in coping with these developments.
- 2) **1998-2014:** a much stronger price and upward trend. There was a very strong rally between 1999 and 2000 as OPEC implemented 4m b/day of production cuts. It was followed by a period of weakness caused by the rollback of these cuts, coinciding with the world economic slowdown, which reduced demand growth and a recovery in Russian exports from depressed levels in the mid 90's that increased supply. OPEC responded rapidly to this during 2001 and reintroduced production cuts that stabilized the market relatively quickly by the end of 2001.

Then, in late 2002 early 2003, war in Iraq and a general strike in Venezuela caused the price to spike upward. This was quickly followed by a sharp sell-off due to the swift capture of Iraq's Southern oil fields by Allied Forces and expectation that they would win easily. Then higher prices were generated when the anticipated recovery in Iraq production was slow to materialise. This was in mid to end 2003 followed by a much more normal phase with positive factors (China demand; Venezuelan production difficulties; strong world economy) balanced against negative ones (Iraq back to 2.5 m b/day; 2Q seasonal demand weakness) with stock levels and speculative activity needing to be monitored closely. OPEC's management skills appeared likely to be the critical determinant in this environment.

By mid-2004 the market had become unsettled by the deteriorating security situation in Iraq and Saudi Arabia and increasingly impressed by the regular upgrades in IEA forecasts of near record world oil demand growth in 2004 caused by a triple demand shock from strong demand simultaneously from China; the developed world (esp. USA) and Asia ex China. Higher production by OPEC has been one response and there was for a period some worry that this, if not curbed, together with demand and supply responses to higher prices, would cause an oil price sell off. Offsetting this has been an opposite worry that non-OPEC production could be within a decade of peaking; a growing view that OPEC would defend \$50 oil vigorously; upwards pressure on inventory levels from a move from JIT (just in time) to JIC (just in case); and pressure on futures markets from commodity fund investors.

Continued expectations of a supply crunch by the end of the decade, coupled with increased speculative activity in oil markets, contributed to the oil price surging past \$90 in the final months of 2007 and as high as \$147 by the middle of 2008. This spike was brought to an abrupt end by the collapse of Lehman Brothers and the financial crisis and recession that followed, all of which contributed to the oil price falling back by early 2009 to just above \$30. OPEC responded

decisively and reduced output, helping the price to recover in 2009 and stabilise in the \$70-95 range where it remained for two years.

Prices during 2011-2014 moved higher, averaging around \$100, though WTI generally traded lower than Brent oil benchmarks due to US domestic oversupply affecting WTI. During this period, US unconventional oil supply grew strongly, but was offset by the pressures of rising non-OECD demand and supply tensions in the Middle East/North Africa.

- 3) **2014-2020:** a further downcycle in oil. Ten years of high prices leading up to 2014 catalysed a wall of new non-OPEC supply, sufficient that OPEC saw no choice but to stop supporting price and re-set the investment cycle. Oil prices found a bottom in 2016 (as a result of OPEC and non-OPEC partners cutting production again), but its recovery was capped by the volume of new supply still coming into the market from projects sanctioned pre the 2014 price crash. Average prices were pinned 2017-19 in the \$50-70/bl range, with prices at the top end of this range stimulating oversupply from US shale. The alliance between OPEC and non-OPEC partners fell apart briefly in March 2020 and, coupled with an unprecedented collapse in demand owing to the COVID-19 crisis, oil prices dropped back below \$30/bl, before recovering to around \$50/bl by the end of 2020 thanks to renewed OPEC+ action.
- 4) **2021 onwards:** Underinvestment in new oil capacity in the 2015-2020 period catalysed the start of a new cycle in 2021, pushing prices above \$75/bl.

North American gas price since 1991 (Henry Hub \$/Mcf)

Source: Bloomberg, April 2024

With regard to the US natural gas market, the price traded between \$1.50 and \$3/Mcf for the period 1991 - 1999. The 2000s were a more volatile period for the gas price, with several spikes over \$8/mcf, but each lasting less than 12 months. On each occasion, the price spike induced a spurt of drilling which brought the price back down. Excepting these spikes, from 2004 to 2008, the price generally traded in the \$5-8 range. Since 2008, the price has averaged below \$4 as progress achieved in 2007-8 in developing shale plays boosted supply while the 2008-09 recession cut demand. Demand has been recovering since 2009 but this has been outpaced by continued growth in onshore production, driven by the prolific Marcellus/Utica field and associated gas as a by-product of shale oil production.

North American gas prices are important to many E&P companies. In the short term, they do not necessarily move in line with the oil price, as the gas market is essentially a local one. (In theory 6 Mcf of gas is equivalent to 1 barrel of oil so \$60 per barrel equals \$10/Mcf gas). It remains a regional market more than a global market, though the development of the LNG industry is creating a greater linkage.

IMPORTANT INFORMATION

Issued by Guinness Global Investors which is a trading name of Guinness Asset Management Limited which is authorised and regulated by the Financial Conduct Authority.

This report is primarily designed to inform you about the Guinness Global Energy Fund and the WS Guinness Global Energy Fund. It may provide information about the Funds' portfolios, including recent activity and performance. It contains facts relating to the equity markets and our own interpretation. Any investment decision should take account of the subjectivity of the comments contained in the report.
