March 2023

GUINNESS SUSTAINABLE ENERGY FUND

The Guinness Sustainable Energy Fund is managed for capital growth and invests in companies involved in the generation, storage, efficiency and consumption of sustainable energy sources (such as solar, wind, hydro, geothermal, biofuels and biomass). We believe that over the next twenty years the sustainable energy sector will benefit from the combined effects of strong demand growth, improving economics and both public and private support and that this will provide attractive equity investment opportunities.

The Fund is run by co-managers Will Riley and Jonathan Waghorn, supported by Jamie Melrose and Dan Hobster (analysts). The investment philosophy, methodology and style which characterise the Guinness approach have been applied to the management of various energy equity portfolios at Guinness since 1998.

RISK

The Guinness Sustainable Energy Fund is an equity fund. Investors should be willing and able to assume the risks of equity investing. The value of an investment and the income from it can fall as well as rise as a result of market and currency movement, and you may not get back the amount originally invested. The Fund invests only in companies involved in the energy sector; it is therefore susceptible to the performance of that one sector and can be volatile. Further details on the risk factors are included in the Fund's documentation, available on our website.

UPDATE ON OUTLOOK FOR SUSTAINABLE ENERGY

This month we review the increasingly positive outlook for the wind industry in light of policy commitments that provide higher levels of investment, long term clarity on tax credits and the promise of faster and simpler project permitting processes. The improving policy outlook also coincides with slowing raw material cost inflation and an improving trend in the wind turbine average sales prices. The outlook for growth and margins looks increasingly more positive for wind equipment companies.

EQUITIES

Global stock markets were weaker in February, with the MSCI World Net Return Index delivering -2.4% in USD. Over the month, the Guinness Sustainable Energy Fund (Class Y) delivered a return of -3.4% (in USD), underperforming the MSCI World by 1.0%. Year to date, the fund is up 6.5%, outperforming the MSCI World which is up 4.5%. Full performance details are available in Section 3.

In the portfolio, the strongest performers included our electrification-biased installation companies, Hubbell and Eaton, following good full year 2022 results. Hubbell outperformed in both its Power and Electrical divisions in 4Q and delivered 2023 guidance ahead of consensus. The weakest performer in the fund was Ameresco, which missed 4Q results and provided weaker than expected Q1 2023 guidance, reflecting timing delays for both its Projects and Assets segments.

CHART OF THE MONTH

Expenditure on clean energy exceeded one trillion dollars in 2022, according to data from Bloomberg New Energy Finance. Expenditure has grown sharply in recent years, up 77% on the level seen in 2020 and up 16%pa on average since 2010. In 2022, overall expenditure was split broadly equally between supply and demand activities, having been biased more significantly towards supply-based activities in previous years.

1. FEBRUARY NEWS AND EVENTS IN REVIEW

In this section, we review the key news items and their impact on our various portfolio sub-sectors over the last month.

News	Sub-Sector	Impact
In Europe, the carbon price briefly exceeded Eur100/tonne for the first time during February reflecting tighter EU emission rules. While the price receded later in the month (closing February at Eur96.6/tonne) it is around 4x higher than it was three years ago, just prior to the onset of COVID.	EU decarbonisation policy	
In its 4 th quarter results, BP received media attention for scaling back its 2030 targets for reducing oil and gas production (from a 40% cut to a 25% cut) but little attention around its announced \$8bn increase in low carbon expenditure. This increase brings planned total low carbon expenditure to \$30bn by 2030. BP guided to expectations of “double-digit” returns from its green hydrogen projects compared with 6 to 8 per cent for straight renewable power projects and more than 15 per cent for biogas, retail convenience and vehicle charging.	Clean energy economics	
Chinese permits for coal plants in 2022 reached their highest levels since 2015, according to a new report from the Centre for Research on Energy and Clean Air and the Global Energy Monitor. China began construction on 52 GW of coal plants in 2022, up 50% from 2021 and six times the capacity under construction in the rest of the world. At the gathering of parliament, the National Development and Reform Commission (NDRC) highlighted that coal would be used to improve the reliability and security of its energy system, “we will strengthen the basic supporting role of coal (and) take orderly steps to increase advanced coal production while ensuring safety”	China local carbon power mix	
According to Bloomberg, Chinese lithium carbonate prices have fallen nearly 50% from highs in November 2022 as result of weaker Chinese EV demand. The weakness appears to reflect the removal of Chinese electric vehicle subsidies at the start of 2023 as well as general low household confidence. Lithium prices have been very volatile and, even after this pullback (to around CNY320k per tonne), are still around 6x higher than the average between 2018-2020.	Battery economics	
A report from the IEA has predicted that renewable energy and cleaner sources of electricity generation are set to provide almost all the new global electricity demand in the three years up to 2025. Overall electricity demand is expected to grow at around 3%pa over the period and will be met 90% by renewables and nuclear. This will allow greenhouse gas emissions from global power generation to plateau by 2025, according to the IEA.	Low carbon power	

2. MANAGER'S COMMENTS

An improving outlook for the wind industry

Wind is the second most significant renewable power generation source. In recent years, the industry has faced headwinds as it has wrestled with COVID-related disruptions and various regulatory “air pockets”. Recent policy announcements as well as the slowing of raw material and energy cost inflation means that sentiment towards wind appears to be turning more positive in recent months.

Recent policy support for the wind industry

Recent policy announcements in the US, Europe and China have been positive for the wind industry, benefitting in particular the onshore wind sector, which had started to lag the growth outlook of the offshore sector.

In early 2022, Europe announced its **REPowerEU plan** which committed a further EUR 86bn in incremental renewables investment out to 2030. While the scale of investment is significant, the Act particularly benefits onshore wind because it seeks to remove Europe's permitting bottlenecks and to streamline the permitting process from an average of 6 years to an average of 2 years. Streamlining this process is critical, we believe, because onshore wind farms typically face higher levels of local opposition. If achieved, we would expect the onshore industry will see a big step up in demand: the backlog of projects awaiting permitting in Europe is around five times the level of annual installations.

Subsequently, the US announced its **Inflation Reduction Act** which outlined a \$369bn package targeting climate and energy security, focusing on reducing emissions from (amongst other things) electricity generation and transport. The Act changes the investment outlook for onshore wind because it extends current tax credits (the Investment Tax Credit (ITC) and the Production Tax Credit (PTC)) to 2033. For a longer cycle investment activity such as wind, this provides much needed visibility around project economics. Historically, the PTC has been made available for much short periods, providing visibility for perhaps one or two years at certain points – a period that is not helpful for wind projects that typically takes at least three years for development. According to Princeton University, the combined incentives may help increase US wind installations by 2x over the next three years compared to 2020 levels.

To remain competitive with the IRA, the EU proposed an **EU industrial strategy** in early February 2023. We expect to hear more details at the 23rd-24th March EU Council meeting but initial plans suggest the introduction of a “European IRA”, designed to increase significantly the manufacturing of clean energy equipment and the installation of clean energy products. One of three key attributes of the plan is **better regulation and the removal of bottlenecks** which would require each member state to speed up the permitting of renewable facilities via a single “approval entity”, so removing the current multi-step approval process that exists in many countries. The introduction of a time limit for the process (that would allow delayed projects to be approved centrally by the EU) as well as further administrative capacity would help to speed up project development timelines. In response, Germany have already announced plans to speed up its own permitting process including proposed legislation that will scrap the environmental impact assessment for wind generation projects. Onshore wind will also benefit from the other areas of increased **financial support for clean energy projects** and the proposal of a **Critical Raw Materials Act** that would allow for the diversified sourcing and recycling of raw materials critical to the energy transition.

The scale of the task ahead for the EU was highlighted by Vestas in its recent full year 2022 results commentary as follows “*the EU Green Deal Industrial Plan aims to accelerate renewables with EU funding to be stepped up but also easing state aid approvals. 2022 installations were 50 percent below climate target and 2022 orders were down 47 percent year-on-year due to slow permitting*”.

The Guinness Sustainable Energy Report

Less talked about has been the **Chinese 14th 5-year renewable energy plan** which aims to double the installed capacity of both wind and solar by 2030. This has led to China's major state-owned power companies setting goals to increase total wind and solar capacity by 600 GW by 2025 (5 years ahead of schedule). This could potentially provide significant opportunity for many of the wind developers and wind power generators that we track in our universe, although it is unlikely that European and US wind turbine manufacturers will be able to benefit since the Chinese market is essentially closed to them.

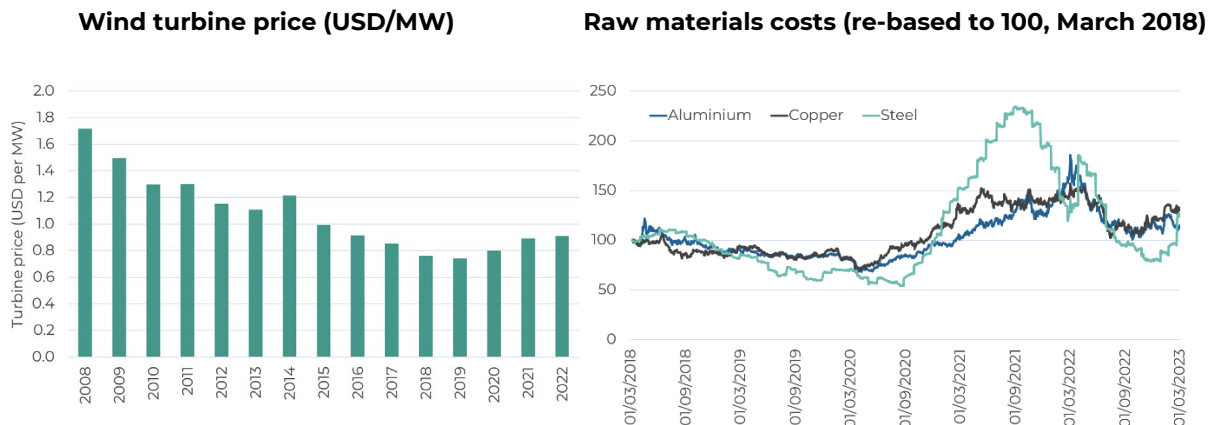

Improving price and margin outlook for turbine manufacturers

Recent policy support actions coincide with signs that wind turbine pricing is starting to improve and raw material costs are starting to fall.

There has been delay in turbine manufacturers passing on cost inflation, reflecting the fact that wind turbine manufacturing is a reasonably long cycle activity with around three years between order and delivery for a wind development.

However, in its latest update, Vestas indicated that the average selling price of its wind turbine order intake was Eur1.15m per MW in Q4 2022, up nearly 34% from the Q4 2021 level of Eur0.86m per MW. Broader industry data from Bloomberg indicates that average per MW wind turbine order prices are up 23% in 2022 versus 2019. We expect the inflationary pricing trend to continue as wind turbine manufacturers sign new contracts, providing an opportunity to pass on raw material, energy and wage increases to their customers.

To the benefit of turbine manufacturers, we note that some of the key raw materials (for example steel, copper and aluminium) appear to be past their periods of highest price rises. Indeed, the current picture suggests that the manufacturers may now start to enjoy a period of turbine price inflation coupled with raw material cost deflation.

Source: Bloomberg

The result of the policy initiatives and the raw material and product price movements mentioned above is that we expect onshore installation growth to triple from our prior 2022-2030 growth rate estimate of 5-6%pa, allowing global onshore wind generation capacity to nearly triple by 2030.

Complementing the improved picture for onshore wind is a positive outlook for the offshore wind industry, which still represents only 7% of global wind capacity. We expect offshore capacity to grow nearly five times by the end of the decade, driven by broader geographic penetration, improving economics and supportive policy. These dynamics have seen us increase our 2030 capacity outlook for offshore wind to close to 300 GW, implying 20%pa growth versus 2021. By then, we expect Europe and China to account for the majority of installations, with the US still accounting for less than 10% (even if President Biden's target 30GW plan is enacted).

Change		12	-2	4	8	-13	16	15	-9	-3	-2	12	35	3	-2	15

The long-term outlook for the wind industry remains very positive as the sector plays a critical role in global decarbonisation and the energy transition. We are increasingly confident that these issues will inflect positively over the next few years as a result of policy as well as price increase and a slowdown in raw material cost inflation, leading to a sustained ramp in global wind installations out to 2030 which will bring total installed capacity to around 2.2 TW in 2030.

However, this base case outlook is not sufficient for a net zero outlook. The Guinness net zero scenario indicates that total installed capacity would need to be 3.1 TW in 2030 (a compound growth rate of 16%pa from 2021) and that reaching this level of installed capacity would require annual installations to reach as much as 400 GW pa. While there appears to be significant policy support to grow the wind industry, we note that it has a very significant way to go in order to be fully aligned.

Global wind annual installations, base case and NZE scenario

The Guinness Sustainable Energy Report

3. PERFORMANCE (to 28.02.2023)

Past performance does not predict future returns.

The Guinness Sustainable Energy Fund (Class Y, 0.67% OCF) delivered a return of -3.4% in the month, while the MSCI World Index (net return) delivered -2.4% (all in USD terms).

	Ytd	1 Yr	3 Yrs	5 Yrs*	10 Yrs*
Fund (Class Y)	6.5%	4.2%	97.8%	114.5%	149.1%
MSCI World NR Index	4.5%	-7.3%	32.7%	39.5%	131.9%
Out/Underperformance	2.0%	11.6%	65.0%	75.1%	17.2%

Annual performance	2022	2021	2020	2019	2018*
Fund (Class Y)	-12.5%	10.4%	84.1%	31.4%	-15.2%
MSCI World NR Index	-18.1%	21.8%	15.9%	27.7%	-8.7%
Out/Underperformance	5.6%	-11.4%	68.2%	3.7%	-6.5%

Annual performance	2017*	2016*	2015*	2014*	2013*
Fund (Class Y)	20.2%	-15.4%	-12.0%	-12.1%	70.8%
MSCI World NR Index	22.4%	7.5%	-0.9%	4.9%	26.7%
Out/Underperformance	-2.2%	-23.0%	-11.2%	-17.0%	44.1%

The Guinness Sustainable Energy Fund was launched on 19/12/2007. *Simulated Past Performance prior to the launch of the Y class on 16/02/2018. The Performance shown is a composite simulation for Y class performance being based on the actual performance of the Fund's E class, which has an OCF of 1.24%. Source: Financial Express, bid to bid, total return. On 31 Dec 2018, the index for the Guinness Sustainable Energy fund became the MSCI World NR Prior to this, the benchmark was the Wilderhill Clean Energy Index (ECO Index)

Investors should note that fees and expenses are charged to the capital of the fund. This reduces the return on your investment by an amount equivalent to the Ongoing Charges Figure (OCF). The fund performance shown has been reduced by the current OCF of 0.67% per annum. Returns for share classes with different OCFs will vary accordingly. Transaction costs also apply and are incurred when a fund buys or sells holdings. Performance returns do not reflect any initial charge; any such charge will also reduce the return.

Within the Fund, the strongest performers were Hubbell, Eaton, onsemi, Legrand and Trane. The weakest performers were Ameresco, Gentherm, Tianneng, TPI Composites and China Longyuan

Stock by stock performance over the month, in USD

4. PORTFOLIO

The Guinness Sustainable Energy Fund is positioned to benefit from many of the long-term themes associated with the transition towards a lower-carbon economy and of sustainable energy generation via investment in companies with activities that are economic with limited or zero government subsidy and which are profitable. Our investment universe comprises around 250 companies which are classified into four key areas:

- **Generation** includes companies involved in the generation of sustainable energy, either pureplay companies or those transitioning from hydrocarbon-based fuels
- **Installation** includes companies involved in the manufacturing of equipment for the generation and consumption of sustainable energy
- **Displacement** includes companies involved in the displacement or improved efficient usage of existing hydrocarbon-based energy
- **Electrification** includes companies involved specifically in the switching of hydrocarbon-based fuel demand towards electricity, especially for electric vehicles

We monitor each of the industry areas very closely and hope that detailed top-down (macro) analysis of each (complemented with disciplined equity screening and stock valuation work) will allow us to deliver attractive fund performance via an equally weighted portfolio of 30 stocks. The portfolio is designed to create a balance between maintaining fund concentration and managing stock-specific risk.

Guinness Global Investors is a signatory of the United Nations Principles for Responsible Investment. The Guinness Sustainable Energy Fund prioritises returns whilst delivering concentrated exposure to companies playing a key role in global decarbonisation. The Fund’s holdings align most closely with four of the UN’s sustainable development goals:

Signatory of:

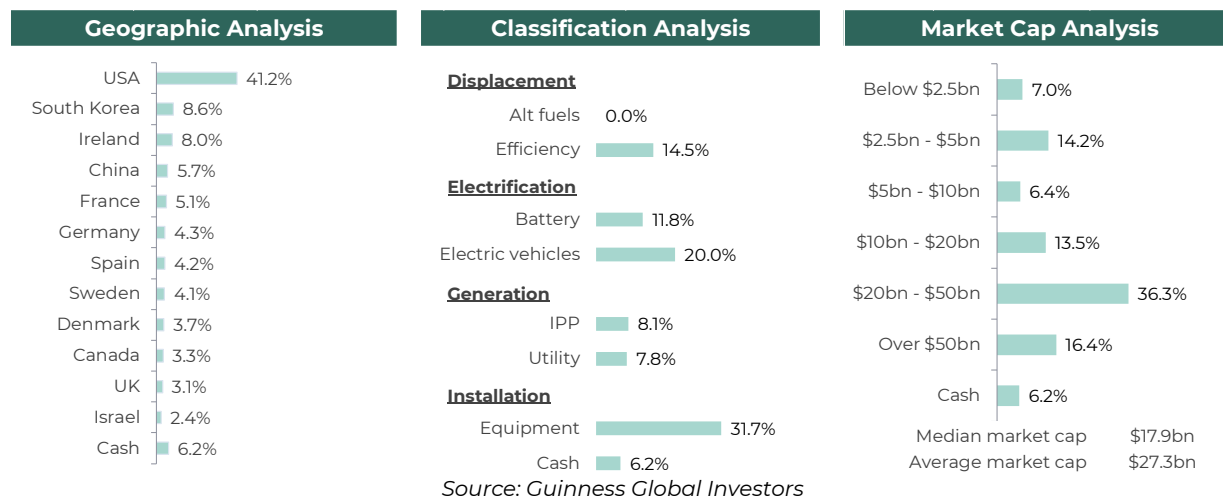

The Guinness Sustainable Energy Report

Buys/Sells

During the month, we initiated a position in Legrand. Legrand is the world's only global specialist in electrical and digital building infrastructures. It sells more than 300,000 individual electrical products, biased to residential and commercial markets, to a broad global customer base. We believe that the company is well placed to benefit from secular trends such as electrification and efficiency.

Portfolio structure analysis

Portfolio sector breakdown

The Guinness Sustainable Energy Report

Portfolio holdings as at end February 2023

Our portfolio is typically allocated across 30 equally weighted equities providing exposure across the value chain of sustainable energy.

We hold c.46% weight to companies associated with the consumption (or demand) of sustainable energy. Our largest exposure here is to companies involved in the electrification of demand, either via the creation of new batteries (12%) or the electrification of transportation (20% weight) while we have 15% weight to those companies involved in either displacing existing energy sources or improving overall energy efficiency.

We hold two lithium-ion battery manufacturers. LG Chem is a large Korean chemicals company that is a top 3 lithium-ion battery manufacturer in the world, while Samsung SDI is a pure play lithium-ion battery manufacturer, currently in the top 10 in the world.

The portfolio holds five names in the electric vehicle sub-category, giving it exposure to companies that provide semiconductors, electronics, components and software/services to the growing EV and autonomous vehicle industry. Onsemi and Infineon are providers of power semiconductors that are a necessity for higher-voltage electric vehicles to become competitive with ICE (internal combustion engine) vehicles, while Gentherm, Aptiv and Sensata are component manufacturers and service providers that should benefit from the ever-increasing amount of electronics present in electric vehicles.

Our displacement holdings provide pure-play quality exposure to heating industries (Nibe Industrier, Trane Technologies), energy efficient electrical equipment and services (Hubbell) and energy efficiency projects (Ameresco), and the group as a whole will benefit from the increasing industry focus on energy efficiency that is expected to be a very long-term trend.

In terms of the supply of sustainable energy, we hold a 16% weight to companies involved in the generation of sustainable energy and 32% weight to those exposed to the installation of or equipment used in the process of sustainable energy generation.

China Suntien and China Longyuan are our two pure play Chinese wind power producers and they represent around a third of our generation exposure. The remaining exposure comes in the form of geothermal (Ormat), US residential solar (Sunnova) and then broad-based wind/solar renewable energy generation through NextEra Energy (the largest producer of renewable energy in the world). Iberdrola is our one utility.

We hold exposure to the solar and wind equipment and manufacturing value chains. Xinyi Solar is the world's largest supplier of the glass used in solar cell modules and both EnPhase and SolarEdge manufacture the inverters required to convert DC solar power into consumable AC electricity. Canadian Solar and First Solar give integrated exposure to the solar cell and module manufacturing process. Vestas is a well placed provider of wind turbines in the world providing broad exposure to the strong growth that we expect in the onshore and offshore wind markets, while TPI Composites offers niche exposure to the high-skilled business of manufacturing wind turbine blades.

Our remaining exposure to Installation (Itron, Eaton, Legrand and Schneider Electric) gives exposure to companies that provide equipment and services to improve the efficiency and metering of electricity transmission and consumption.

The Guinness Sustainable Energy Report

Portfolio themes as at end January 2023

Theme	Example holdings	Weighting (%)

5. OUTLOOK - sustainable energy & the energy transition

Sustainable energy: the long-term outlook

Over the next thirty years, the world will continue its transition to a sustainable energy system. The key factors driving the transition are:

- **Population and GDP growth** putting a significant strain on today's energy supply
- **Economics** as sustainable sources of energy will be cheaper than the incumbents
- **Climate change** leading the world to reduce carbon emissions via cleaner energy
- **Pollution** forcing governments to drive air pollution out of cities via cleaner energy
- **Energy security** as sustainable energy sources, which are more evenly spread across all countries, facilitate lower reliance on energy imports.

The outcomes of the energy transition will of course be wide-ranging. On the **supply** side, we see a sustained shift towards renewable power generation, fulfilling global power generation needs which are set to double by 2050. On the **demand** side, we believe that improved energy efficiency will be key to limiting energy consumption growth to a manageable level so that it can be increasingly satisfied by renewable sources.

The long-term direction is clear and is driven by economics, in our opinion, while near term geopolitical issues (such as the invasion of Ukraine in February 2022) could potentially have an effect on the speed of the transition and the relative importance of the factors stated above.

Within the power generation industry, we expect a radical change in energy mix. Today, the global power mix is predominantly driven by coal and natural gas (35% and 24% respectively), whilst variable renewable generation (wind and solar) have less than a 10% share. By 2035, we expect wind and solar to have grown to around 40% of the generation mix, increasing to around 60% by 2050.

Global power generation by type (TWh, 1995-2040E)

Sources: BP Statistical Review; IEA: Guinness Global Investors estimates; as of 31.12.2021

Policy support for decarbonisation

Policy commitment in recent years has been particularly supportive. However, the path has not always been smooth and it is unlikely to be a smooth ride from here. The most significant policy milestones in the recent period include:

- **President Biden returning the US to the Paris Agreement** and announcing significantly increased 2030 GHG reduction targets. The new target - a 52% reduction in emissions by 2030 (vs 2005 levels) - was substantially ahead of the old target of a 28%

The Guinness Sustainable Energy Report

reduction by 2025.

- **The 2021 IPCC climate report.** The Intergovernmental Panel on Climate Change (IPCC) published its sixth assessment report on the physical science of climate change and the physical impacts of various carbon emission and warming scenarios
- **COP26 climate conference.** In November 2021, the COP26 climate conference was held in Glasgow. The conference produced results which we considered to be better than feared, but not as good as hoped. Key headlines included new net zero targets, additional country pledges and some 'alliances of the willing' to reduce coal usage and methane emissions.
- **Carbon pricing.** Developments in carbon pricing remain hopeful with momentum towards the introduction of emissions trading schemes (ETS) as a tool for decarbonisation. At the start of 2021, China commenced a new national ETS scheme which immediately became the world's largest carbon market (covering around 2,225 entities in the power generation industry with annual emissions of around 4,000 MtCO₂e) while Canada introduced a federal carbon tax that will increase by 2030 to around US\$130/tonne.

While policy towards stimulus plans continues to be positive, the passage of actual investment into the energy transition has been slower than expected and still remains a positive catalyst from here. The influential US "Build Back Better" (BBB) infrastructure package is the clearest example of the delay between policy announcement and actual investment. After it passed the House of Representatives in November, Democrat Senator Joe Manchin announced on December 19th that he would not be supporting the \$1.75trn BBB bill (as currently written) thus delaying the passage of the bill through the House of Congress. A compromise bill, the Inflation Reduction Act (IRA) which includes \$369bn of support for clean energy investment was passed in summer 2022 but was significantly smaller than Biden's initial proposed support package. In addition, the REPowerEU deal that was announced in March 2022 has a similar quantum of investment support but is unlikely to yield new investments until 2023/2024 and well into the second half of this decade. Both the IRA and the RePowerEU deal were direct responses to the Russian invasion of Ukraine and will both help to accelerate the energy transition.

Energy displacement

It is a common misconception that achieving rapid growth in renewable power generation will be enough to deliver government targets for pollution, energy security and de-carbonisation. Renewable power generation is a key part of the solution, but we see the displacement and more efficient use of existing energy sources as just as critical, and arguably more urgent, in achieving these goals. The IEA refers to the theme of energy efficiency as being the 'first fuel' that should be considered in delivering the energy transition. It is the one energy source that every country can access in abundance today.

In our base case, we assume global energy demand growth over the next thirty years of around 1%pa. This assumes significant efficiency improvements relative to an historical energy demand growth rate of around 2%pa. For our base case scenario to be achieved, per capita energy demand over the next thirty years needs to stay broadly flat, whilst the energy intensity of global GDP needs to fall by around 40%.

Within the energy displacement sector, key areas of focus are **efficiency** and **alternative fuels**.

Energy efficiency

Energy efficiency measures were negatively impacted by Covid in 2020, as projects and investments were disrupted, but it appears that governments are turning their attention to efficiency measures as part of post-Covid stimulus measures. There is urgency to do this as current government policies imply that annual energy efficiency improvements need to increase by around 50% from a long-term historic 1.5%pa to a forecast level of 2.3%pa.

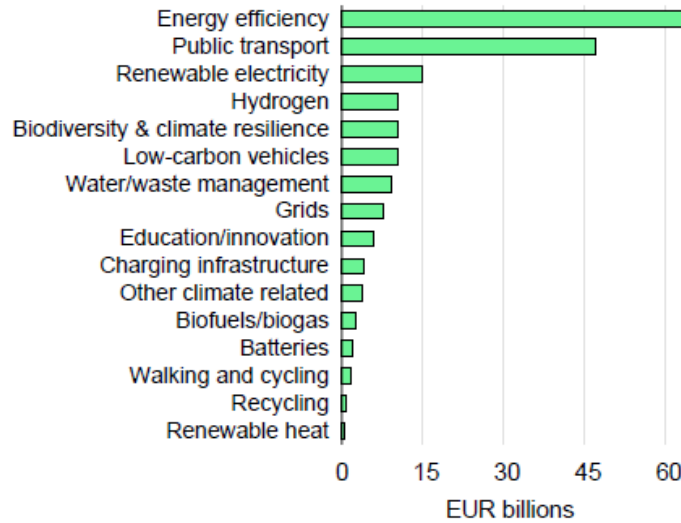

Energy efficiency measures are typically employment-intensive and offer a cheap form of carbon abatement. These factors help explain why the efficiency sector has received around US\$144bn of stimulus spending since the start of Covid, the largest allocation within clean

The Guinness Sustainable Energy Report

energy spending globally. The renovation of public and private buildings and energy efficiency investment in the industrial sector are the largest beneficiaries of the allocated spending.

Despite the acceleration of energy efficiency spending for buildings, current spending plans will only be enough to keep total building heat consumption flat over the next few years, as per square foot efficiency gains are offset by an expanding stock of buildings.

EU Recovery and Resilience Facility (RFF) fund allocation

source: IEA World Energy Outlook 2022

Based on current government policies, the IEA estimates that energy efficiency spending needs to increase this decade from around \$250bn pa to around \$375bn pa, rising to \$550bn in the 2030s. Within REPowerEU, the European Commission recognises that energy efficiency is the cheapest, cleanest, and quickest way to reduce the bloc's reliance on fossil fuel imports and reduce energy bills and the EU has increased energy efficiency targets from 9% to 13% accordingly.

However, current activity, plus recent subsidy announcements, are not sufficient to deliver even the IEA's base case, which is far from net zero.

Alternative fuels

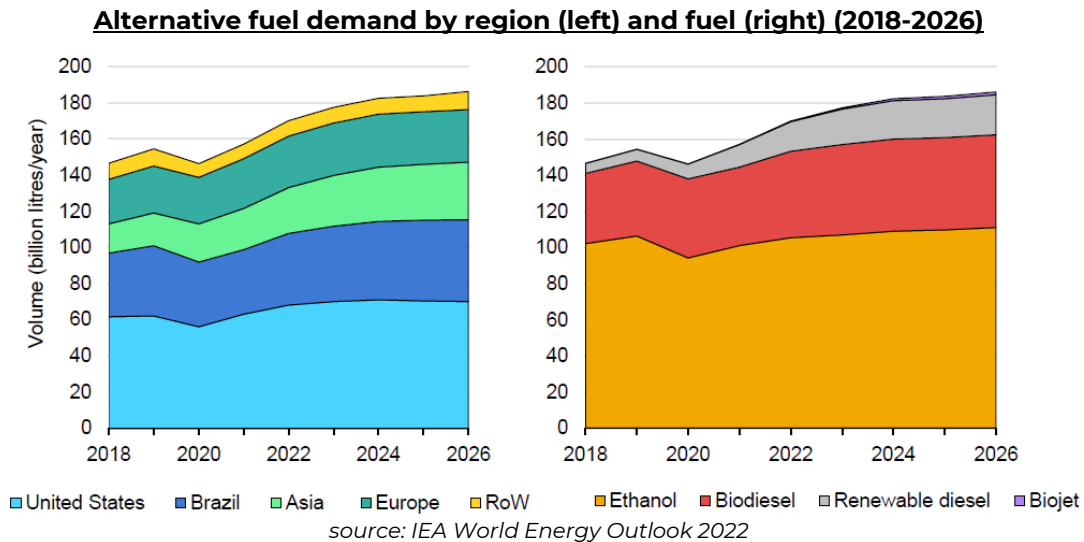

Alternative fuels such as ethanol (which displaces gasoline), biodiesel and renewable diesel (which displace conventional diesel) and Sustainable Aviation Fuels (SAF, which displace conventional jet fuel) serve a role in displacing existing fossil fuel demand, predominantly in transportation. In 2021, the global alternative fuel demand was nearly 160bn litres (over 2.5m b/day), representing nearly 3% of world oil transportation demand. The US has the largest alternative fuel market, at around 60bn litres (40% of the global market) where around 10% of all road fuel consumed is classified as alternative.

Alternative fuels consumption in 2021 grew by 10% versus 2020 and 3% versus 2019. Demand growth was significantly stronger than the underlying 6% increase in global oil demand, underlining the policy support for increased blending of alternative fuels in the transportation mix. Renewable diesel demand in the US and biodiesel demand in Asia were the biggest growth drivers. Over the next five years, alternative fuel demand is likely to grow at around 4%pa, reaching 186bn litres and continuing to outgrow global oil demand growth.

With regard to product mix, we see ethanol having the largest absolute demand growth, but its market share recedes to around 60% as demand for renewable diesel (using feedstocks such as used cooking oil, corn oil or rendered animal fats) accelerates and overtakes the current leading biodiesel technology. Combined, ethanol and renewable diesel satisfy 80% of the demand growth over the next five years.

The Guinness Sustainable Energy Report

We expect Asia to be the fastest growing market, driven for example by India's 20% ethanol blending target for 2025. However, North America will remain the largest market (40% market share) followed by Latin America (27% market share, driven by ethanol in markets like Brazil) and Asia (17% market share) and overtaking Europe (<15%).

On an unsubsidised basis, alternative fuels typically look expensive. Reliance on government subsidies increases the risk around the medium-term growth outlook. For example, in the US, there was significant uncertainty in 2021 around the Renewable Volume Obligation (RVO), a volume-driven subsidy. Various price-related subsidies in the US have also been volatile. In October 2021, the aggregate value of the subsidies, including Renewable Identification Numbers (RINs), Low Carbon Fuel Standards credits (LCFS) and the biodiesel Blenders Tax Credit (BTC), was around \$4/gallon. With wholesale conventional diesel prices at around \$2.50/gallon, it is clear how important subsidy is in delivering the growth of the biodiesel and renewable diesel industry in the US.

Electrification

The energy transition is seeing energy demand being 'electrified' as it moves away from predominantly hydrocarbon fuels and gases towards the consumption of electricity. Our 'electrification' sector includes some key enablers of this transition: the lithium-ion battery and the electric vehicle industries. The battery industry is critical here in that it will serve electric vehicles and also provide a stationary energy storage solution in electricity grids, allowing variable renewable energy (i.e. solar & wind) to play an expanding role in the global power stack.

Batteries

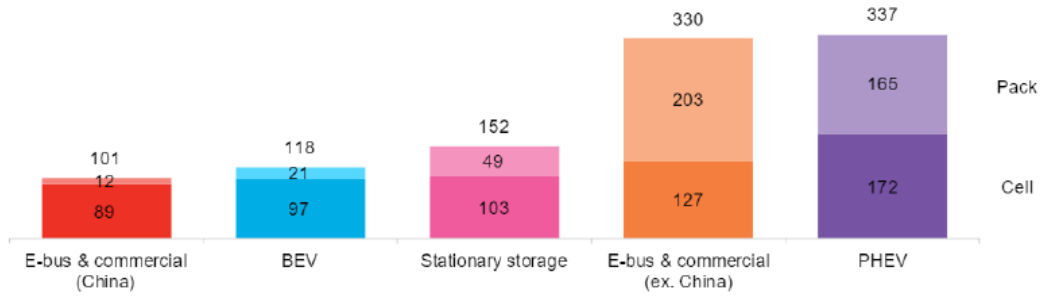

The catalyst for greater **lithium-ion battery** use has been sharp falls in the cost of manufacturing. According to BNEF, battery pack costs are down 89% over the period 2010 to 2021 (an implied 'learning rate' of around 18%) with the average cost being \$132/kWh in 2021 (split \$101/kWh for the cell itself and an additional \$31/kWh for the pack).

The \$132/kWh survey outcome for 2021 is an average calculated across a wide range of uses and regions. China was typically the lowest-cost manufacturer with some individual passenger EV battery packs at below \$100/kWh (and e-bus and commercial vehicle packs at \$101/kWh on average) while BNEF calculated that Tesla's estimated average pack price in 2021 was around \$112/kWh. The survey also includes stationary storage solutions which saw a fall in cost of around 16% in 2021, to \$152/kWh, as manufacturers turned to simple and cheaper battery chemistries, such as lithium-ion phosphate, to offset raw material inflation.

The Guinness Sustainable Energy Report

BNEF lithium-ion battery survey 2021 (\$/kWh)

source: BNEF

Raw materials make up around 50% of the cost of a lithium-ion battery pack, with cathode materials alone representing around 30% of the total cost. The key catalyst material is lithium carbonate, whose price in China rose by 270% in 2021. While battery manufacturers have long-term contracts and approaches in place to mitigate such inflation, they ultimately have little choice but to pass on the costs to consumers. In Q4 2021, BYD increased its battery prices by 20%.

Raw material cost inflation will continue to have an impact in 2022 and we see the likelihood that the cost of manufacturing may exceed levels seen in 2020. Rapidly increasing manufacturing capacity, (bringing further efficiencies of scale) together with reduced supply chain disruptions should help to alleviate the cost pressures in subsequent years and allow the average cost of producing a lithium-ion battery for an EV is likely to fall towards \$100/kWh in the mid-2020s, somewhat later than we previously expected.

While the \$100/kWh cost level is a key target, we note that in 2021 the battery and EV industry started focusing on manufacturing costs well below \$100/kWh. EV manufacturers started to vertically integrate with battery manufacturers and form battery manufacturing JVs such as BlueOvalSK (Ford/SK) and Ultium Cells (GM/LG Energy Solutions) in efforts to improve manufacturing efficiencies with \$60/kWh targets discussed for the end of the decade. The US Department of Energy also set \$60/kWh as its 'stretch' goal, a level would be achieved by 2030 if the current 18% learning rate is maintained.

Cumulative demand for LiB packs (MWh) vs Battery pack price (\$/kWh)

2010-2021 (2022 & 2023 estimates). Source: Bloomberg, Guinness Global Investors

Electric Vehicles

Electric vehicle (EV) adoption continues apace in 2022. Based on data from Cleantechnica, around 5.8 million plug-in vehicles were sold from January to August this year, more than was sold in all of 2019 and 2020 combined. At the current rate, we could see EV sales for the full year exceeding 10 million units. August was a particularly strong month for EVs, with the battery electric (BEV)

The Guinness Sustainable Energy Report

global market share reaching 11% and the share of all plug-in vehicles reaching 15%. This strong performance takes year-to-date plug-in penetration to approximately 13%, split around 9% for BEVs and 4% for plug-in hybrids (PHEVs).

Global sales growth is around 60% year over year (down from 130% last year) with China increasing its market share to around 60%, up from 40% in 2021. Just in the last 12 months, China has significantly extended its lead over the European market which is now in a distant second place with around one quarter of overall EV sales. The US continues to lag behind, making up just under 10% of global EV sales.

Source: Guinness, Cleantechica. Data to 31.08.2022

Policy support, both in terms of incentives to purchase new EVs and legislation to ban the sale of ICE vehicles, continues to underpin the uptake of EVs. The IEA estimates that governments around the world provided nearly \$30bn of incentives in 2021 to support \$250bn of consumer spending on electrified transport. Despite this headline number being nearly double 2020's figure, government support is slowly being reduced with incentives now making up around 10% of spending on electric cars, down from around 20% only five years ago. To support the transition, over 40 countries now have some form of legislation that either bans internal combustion engine sales or restricts tailpipe emissions.

Looking ahead, 2022 looks like it may be the first year where EVs claim over 10% of annual passenger vehicle sales driven by improving economics, driving range, and charging times.

On a global basis, we expect EVs will represent around 20% of new vehicle sales in 2025 (concurrent with the cost of EV lithium-ion batteries falling to around \$100/kWh), 50% of new vehicle sales in 2030 and nearly all new vehicle sales by 2040. At that point, it implies an overall EV population of around 1bn vehicles, over sixty-five times greater than the global population of around 15m EVs at the end of 2021. With EVs using roughly one third of the energy of a typical internal combustion engine vehicle, this transition alone will have substantial impact on global energy efficiency and global decarbonisation.

The Guinness Sustainable Energy Report

Global EV population (to 2050)

Source: IEA; Guinness Global Investors estimates

Despite these rapid EV growth assumptions, we calculate that oil demand from passenger vehicles will not peak until around 2024/25 and that, even by 2030, passenger vehicle oil demand will be similar to 2021 levels. With transportation generating just over 7bn tonnes of carbon emissions in 2020, accelerating the transition and reducing associated oil demand is critical to achieving a net zero 2050 scenario.

Generation & installation (equipment)

Before considering the detailed dynamics of key renewable power generation markets of wind and solar, it is worth considering the significant changes that have occurred to the economics of various renewable power generation technologies since 2010. Onshore wind and solar PV have joined hydro and geothermal power to sit at the lower end of, or below, the cost range for new fossil fuel power generation.

The structural story of cost reduction that we have witnessed for a number of years has recently been complicated by cyclical raw material, energy and logistics cost inflation. However, while the cost of renewable power generation is likely biased upwards short-term, the **relative economics of renewables versus hydrocarbons** continue to improve thanks to fossil fuel generation inflation.

Global LCOE (Levelised Cost of Electricity) of utility-scale renewable power generation technologies (2010–2021)

source: IRENA, Guinness Global Investors estimates

The Guinness Sustainable Energy Report

The solar sector

Solar's improved relative economics and the increased need for security of supply mean that installations in 2022 are likely to be around 260 GW, substantially higher than the 200 GW estimate that we made at the start of the year. With momentum strong, especially following the US Inflation Reduction Act (IRA) and the RePowerEU deals, we introduce an estimate for 2023 module demand of 310 GW, another record year for global installations, with growth of 50 GW versus 2022.

Regionally, the key moving parts in 2022 and 2023 are as follows:

- In the **United States** we initially expected installations in 2022 (20 GW) to be lower than 2021 (30 GW) as a result of i) the Withhold Release Order (WRO) placed on various solar product imports from China, ii) concerns around the level of residential solar support coming from a clean energy infrastructure bill and iii) the impact of new net metering rules (NEM3.0) in California which reduce the attractiveness of solar economics for residential consumers. Actual installations in 2022 are now likely to be around 25 GW as NEM3.0 appears to be less of a threat (although it is still unresolved) and the WRO has not been as negative as initially feared. While the passing of the IRA in 2022 is a clear positive for solar, we do not expect the effect of the bill to be felt until 2023 and for it to be spread over a number of years, with installations reaching the 2021 peak of 30 GW again in 2023 and growing thereafter.
- Demand in **Europe** is expected to be around 45 GW in 2022, up from 24 GW in 2021, as the region reacted to higher fossil fuel generated electricity prices (as a result of lower Russian natural gas imports) and the need for energy security. It is here that the relative economics of solar have improved the most and the RePowerEU deal has already started to incentivise new demand for solar installations. According to BNEF, Europe imported \$2.5bn of Chinese PV products in July 2022, up \$1.5bn on the level from July 2021. Looking to 2023, we see further installation increases, with Europe reaching a new record of 62 GW spread well across an increasing number of countries, leading to substantially more growth in future years.
- In **China** module demand is also likely to beat our initial estimates, reaching 95 GW in 2022 (up 30 GW on 2021) as first half 2022 installations of 40 GW were more than double the levels seen in 1H 2021. Growth has come across utility, residential and commercial and we note plans for the development of significant offshore utility scale plants in 2023. As with Europe, higher power prices have been a key factor in driving stronger demand. In mid 2022, China published its 14th five year plan for renewables which suggested that solar (and wind) installations in 2021-2025 should be double the levels seen in 2015-2020. Accordingly, we expect China will see more growth in 2023, reaching around 115 GW, double the levels seen in 2020/2021, and representing around 37% global market share.
- The rest of the **non-OECD** has also seen greater than expected growth in demand, estimated to reach around 60 GW in 2022 (up 23 GW on 2021 levels) with demand increases well spread across Latin America (especially Brazil), African and Middle Eastern countries. Indian installations look particularly impressive but activity was front-end loaded in response to a new import tax policy that placed a 40% surcharge on imported panels from April 2022.

Considering all these factors, we believe that installations could exceed 300 GW in 2023, and are potentially biased higher, with the non-OECD (at 195 GW) still dominating with a 63% market share.

Solar supply chain in 2022 and 2023

All parts of the solar module manufacturing chain, except polysilicon, appear to have been in oversupply again in 2022 and are likely remain so in 2023. We treat nameplate capacity estimates here with some caution because technological advances and cost improvements can bring rapid capacity obsolescence meaning that actual supply may well be lower than nameplate capacity. Nonetheless, significant new manufacturing capacity is planned across the entire value chain which will likely bring lower module prices and will likely help to support global solar module demand.

- Polysilicon** is a key raw material for a solar wafer and the poly market continued to be the tightest part of the solar market in 2022, evidenced by polysilicon prices rising through the year to reach nearly \$40/kg in August. Poly prices have been high enough over the past two years to incentivise new supply and we can now see signs that the new supply is on the cusp of arrival. BNEF estimates that the capacity of the poly silicon industry rose to 900 Mtpa in 2022 (sufficient to support over 300 GW of solar module manufacturing) but that new capacity additions of nearly 2,500 Mtpa are being planned by either existing players or new entrants. While a number of plants will not be built and many will take longer than expected to reach full production capacity, the scale of capacity growth leads us to believe that poly prices and associated margins for poly producers will fall in 2023 and beyond, allowing margin expansion elsewhere in the value chain as well as lower solar module prices.
- Wafer and solar cell** manufacturing capacity, according to PV InfoLink, will reach 583 GW in Q4 2022 and to grow a further 15% in 2023. In 2022, wafer and cell companies have generally been able to pass through cost inflation and to defend reasonable margins but, similar to polysilicon, this may come under pressure in 2023 as new capacity is added. Unlike polysilicon however, the wafer business is highly concentrated with nearly 80% of 2022 wafer capacity is in the hands of the five largest producers. This may be a factor to help support prices in 2023. A consideration slightly longer term will be the rate at which demand moves from p-type wafers to n-type wafers (with greater efficiency and lower degradation) and how this might cause some existing wafer and cell manufacturing capacity to become obsolete, effectively leaving this part of the market tighter than initially apparent.
- Solar module** prices have moderated so far in 2022, down to around US\$0.25/W currently, and are likely to average in 2022 the levels seen in 2021. With elevated polysilicon and power prices, it is the module manufacturers that have suffered the greatest margin compression so far in 2022. Module manufacturing nameplate capacity in 2022 is estimated to be around 470 GW, of which around 310 GW is newer 'Tier 1' capacity with lower costs resulting from the scale of manufacturing and new technologies. In 2023, this likely expands to 660 GW and potentially to as high as 820 GW by the end of the year.

The wind sector

The long-term outlook for the wind industry remains very positive as wind power will play a critical role in global decarbonisation and the energy transition. Global wind generation capacity today is around 700GW with annual installations in 2022 expected to be around 105GW.

However, the wind industry is suffering short-term pressures as recent sharp peaks in installation demand (a 50% increase to 98 GW in 2020, driven by tax incentives and policy changes) have moderated and have been compounded by Covid-related project delays, raw material cost inflation, logistics issues and permitting constraints.

Wind turbine manufacturing is raw material intensive. According to Vestas in December 2021, steel plate prices were up 2x and resin up 2.5x versus the start of 2020. In terms of logistics, the cost of shipping containers was up 4x and the cost of delivery vessels was up 2x in 3Q 2021 vs 2020. While these cost increases are significant, they were compounded by supply chain issues, such as a 4x increase in the average time that equipment spent waiting in Chinese ports and a 50% reduction in the reliability of scheduling.

Below, we consider the key factors for the onshore and offshore wind markets in 2021 and beyond, concluding that the near-term issues are likely a bump in the road on the journey to delivering wind as the second most significant renewable power generation source.

Onshore wind

Global onshore wind installations in 2021 were around 83 GW, down 8 GW from the record level seen in 2020 but still up 28 GW on the pre-pandemic installation level of 55 GW in 2019.

The Guinness Sustainable Energy Report

Onshore wind installations had been growing very steadily since 2008, averaging an increase of around 3 GW pa, with China representing around 70% of the annual growth. Chinese demand peaked sharply in 2000 and we expect installations to moderate to the longer-term trend resulting in around 41 GW of installations in 2022.

Outside China, onshore installations reached a new high in 2021, averaging 42 GW, up 5 GW on 2020 levels. Onshore installations outside China are expected to be slightly higher again in 2022, achieving a new record level of around 44 GW.

Combined with underlying new project increases, we note that by 2030 around one third of the world's total installed capacity will be more than 13 years old and will be strong candidates for refurbishing.

Offshore wind

Offshore wind remains a nascent industry, at only 17% of the size of onshore (by annual installations in 2021), but one where the growth trajectory is becoming increasingly visible.

Annual installations of offshore wind capacity have increased from 0.9GW in 2010 to a new high of 17 GW in 2021. Chinese offshore installations reached 14 GW in 2021 while ex-China installations are likely to grow from 3 GW in 2021 to a new high of 7 GW in 2022.

The economics of offshore wind continue to improve and there was further constructive cost data in 2021 suggesting that the LCOE for the median offshore wind project halved between 2010 and 2020, and now sits at the bottom end of the competing fossil fuel generation cost range. The growing interest underlines the significant potential of the offshore industry which benefits from better operational (higher and more reliable wind speed) and visual characteristics as well as being close to key demand areas which are often coastal.

In the later part of this decade, we expect annual offshore wind installations to represent around 20% of the total wind market with cumulative installations in offshore between 2020 and 2030 likely to be around 140 GW. A broader spread of countries including the United States, Chinese Taipei, Korea, Vietnam and Japan means that cumulative installations will be split around 30 GW in the Americas, 90 GW in Europe, Middle East and North Africa and around 20 GW in Asia Pacific. The current European market will continue to grow, as excess offshore wind generation will be utilised for the generation of green hydrogen via electrolyzers, and while the Chinese market will also grow it will not be as dominant globally as it is in the onshore market.

The outlook for offshore wind installations

IMPORTANT INFORMATION

TB Guinness Sustainable Energy Fund: The Guinness Sustainable Energy strategy is also available via a UK-domiciled vehicle - TB Guinness Sustainable Energy Fund. The documentation needed to make an investment, including the Prospectus, the Key Investor Information Document (KIID) and the Application Form, is available from the website www.guinnessgi.com.

Issued by Guinness Global Investors, a trading name of Guinness Asset Management Limited, which is authorised and regulated by the Financial Conduct Authority.

This report is primarily designed to inform you about recent developments in the energy markets invested in by the Guinness Sustainable Energy Fund. It also provides information about the Fund's portfolio, including recent activity and performance. This document is provided for information only and all the information contained in it is believed to be reliable but may be inaccurate or incomplete; any opinions stated are honestly held at the time of writing, but are not guaranteed. The contents of the document should not therefore be relied upon. It is not an invitation to make an investment nor does it constitute an offer for sale.

Documentation

The documentation needed to make an investment, including the Prospectus, the Key Information Document (KID) / Key Investor Information Document (KIID) and the Application Form, is available in English from www.guinnessgi.com or free of charge from:-

- the Manager: Link Fund Manager Solutions (Ireland) Ltd (LFMSI), 2 Grand Canal Square, Grand Canal Harbour, Dublin 2, Ireland; or,
- the Promoter and Investment Manager: Guinness Asset Management Ltd, 18 Smith Square, London SW1P 3HZ.

LFMSI, as UCITS Man Co, has the right to terminate the arrangements made for the marketing of funds in accordance with the UCITS Directive

Investor Rights

A summary of investor rights in English is available here:

<https://www.linkgroup.eu/policy-statements/irish-management-company/>

Residency

In countries where the Fund is not registered for sale or in any other circumstances where its distribution is not authorised or is unlawful, the Fund should not be distributed to resident Retail Clients. **NOTE: THIS INVESTMENT IS NOT FOR SALE TO U.S. PERSONS.**

Structure & regulation

The Fund is a sub-fund of Guinness Asset Management Funds PLC (the "Company"), an open-ended umbrella-type investment company, incorporated in Ireland and authorised and supervised by the Central Bank of Ireland, which operates under EU legislation. If you are in any doubt about the suitability of investing in this Fund, please consult your investment or other professional adviser.

Switzerland

This is an advertising document. The prospectus and KID for Switzerland, the articles of association, and the annual and semi-annual reports can be obtained free of charge from the representative in Switzerland, Carnegie Fund Services S.A., 11, rue du Général-Dufour, 1204 Geneva, Switzerland, Tel. +41 22 705 11 77, www.carnegie-fund-services.ch. The paying agent is Banque Cantonale de Genève, 17 Quai de l'Île, 1204 Geneva, Switzerland.

Singapore

The Fund is not authorised or recognised by the Monetary Authority of Singapore ("MAS") and shares are not allowed to be offered to the retail public. The Fund is registered with the MAS as a Restricted Foreign Scheme. Shares of the Fund may only be offered to institutional and accredited investors (as defined in the Securities and Futures Act (Cap.289)) ('SFA') and this material is limited to the investors in those categories.

Telephone calls will be recorded and monitored.
